Elastic Observability

Payments slow. Pending work grows. Make the next move clear.

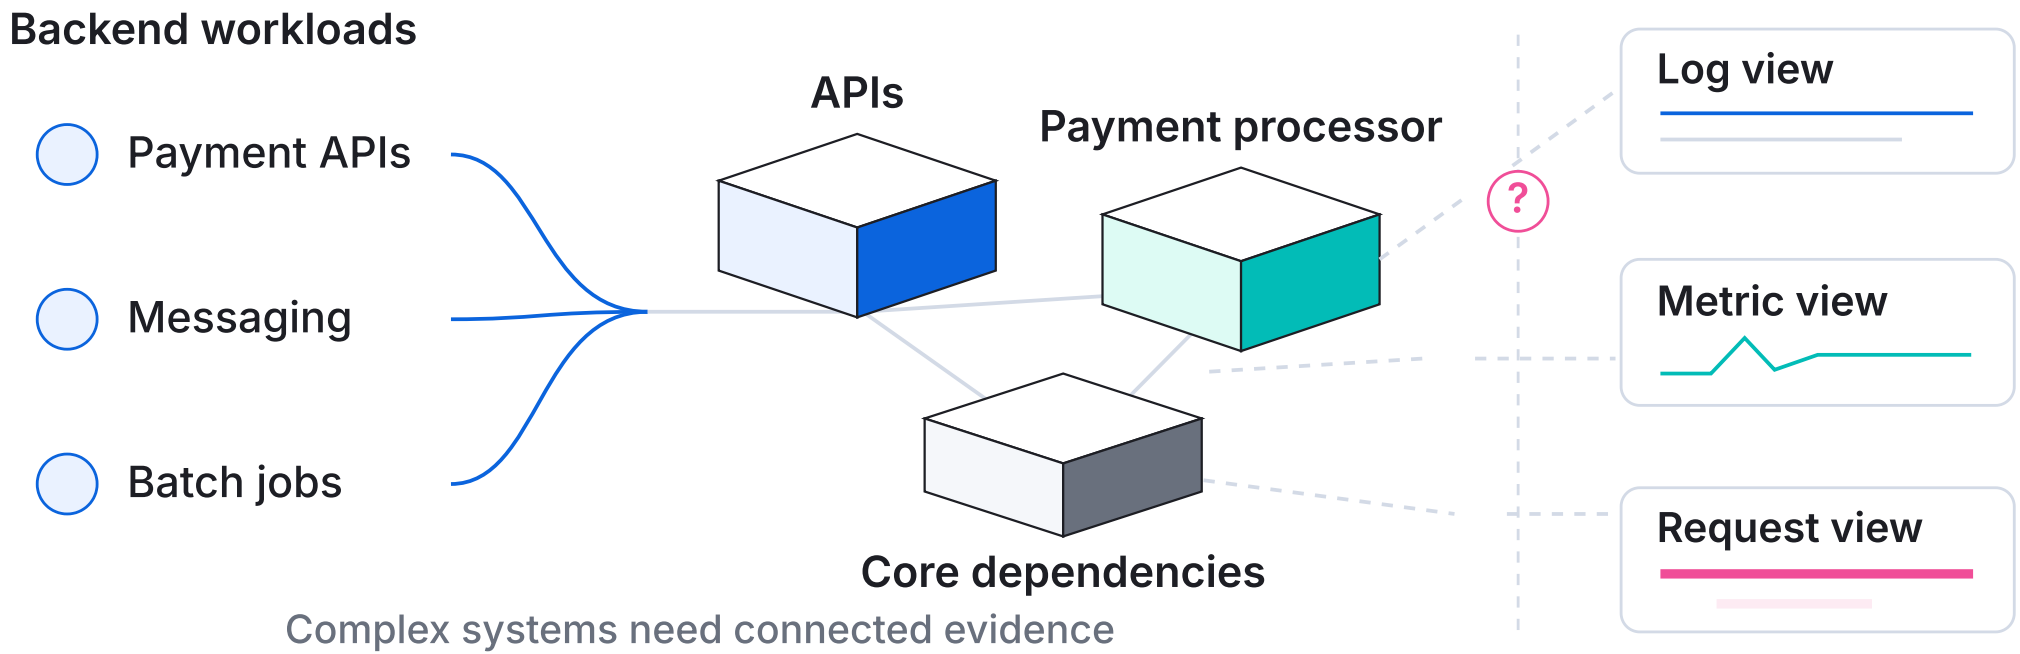

Connect the operational evidence. Verify the cause. Coordinate the response.

ELASTIC OBSERVABILITY Original illustrations. Product availability depends on the deployed release and subscription.

PUBLIC SOURCES Elastic Observability overview ↗ Elastic Streams overview ↗ Elastic Workflows overview ↗

The backlog is growing. Where is the cause?

Payment APIs, messaging, processing services and core dependencies each hold part of the answer.

Complex systems need connected evidence

An alert starts the clock. Shared evidence tells the right team where to look.

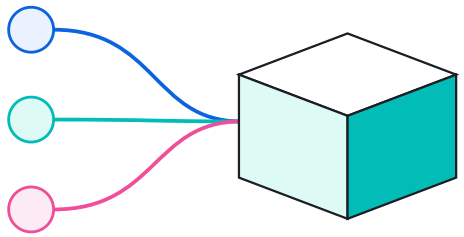

ILLUSTRATIVE · NO LIVE SYSTEMS CONNECTED Illustrative bank architecture. Actual systems and telemetry coverage must be established.

PUBLIC SOURCES Elastic Observability overview ↗ Elastic for financial services ↗

Open. Connected. Actionable.

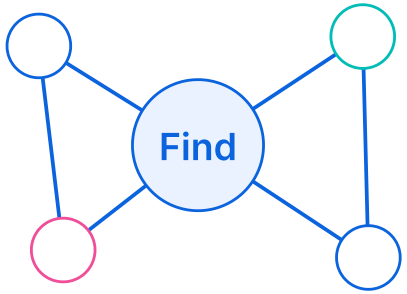

Bring data in openly, preserve its context, and turn useful findings into repeatable action.

Open

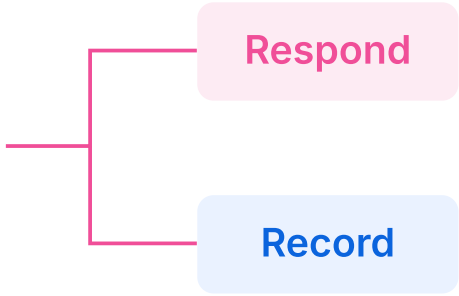

Collect with choice

Connected

Investigate in context

Actionable

Repeat useful actions

One search foundation connects the loop

Prepare the evidence once. Carry its context into investigation and action.

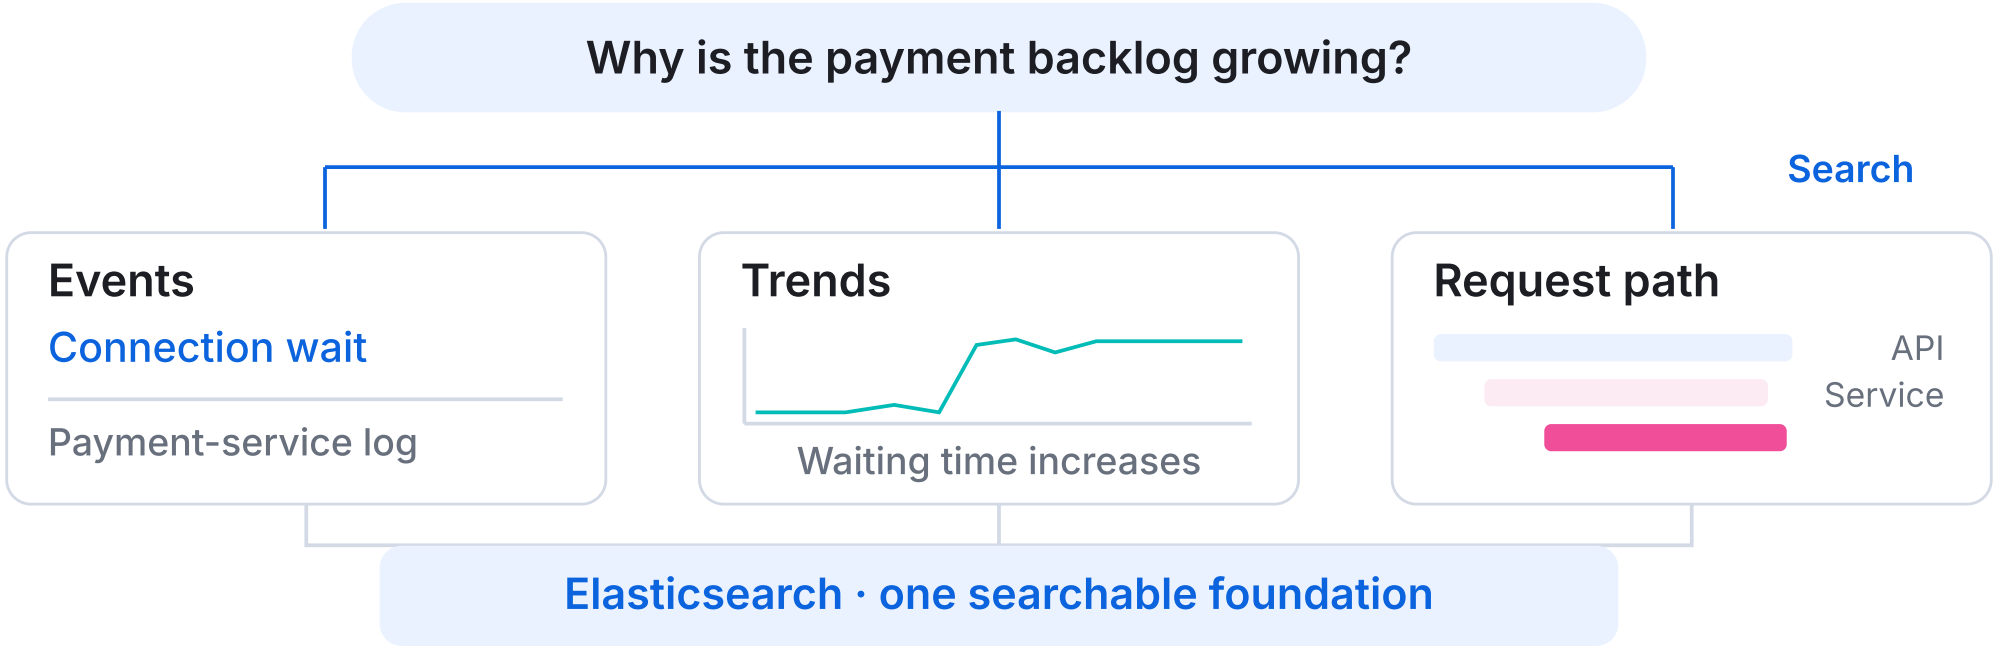

ELASTIC OBSERVABILITY Architecture overview. Collection, correlation and automation require configuration and appropriate access.

PUBLIC SOURCES Elastic Observability overview ↗ Elastic Streams overview ↗ Elastic Workflows overview ↗

elastic

Search beyond the dashboard

Follow a new question from the backlog alert into service events, performance trends and request timing.

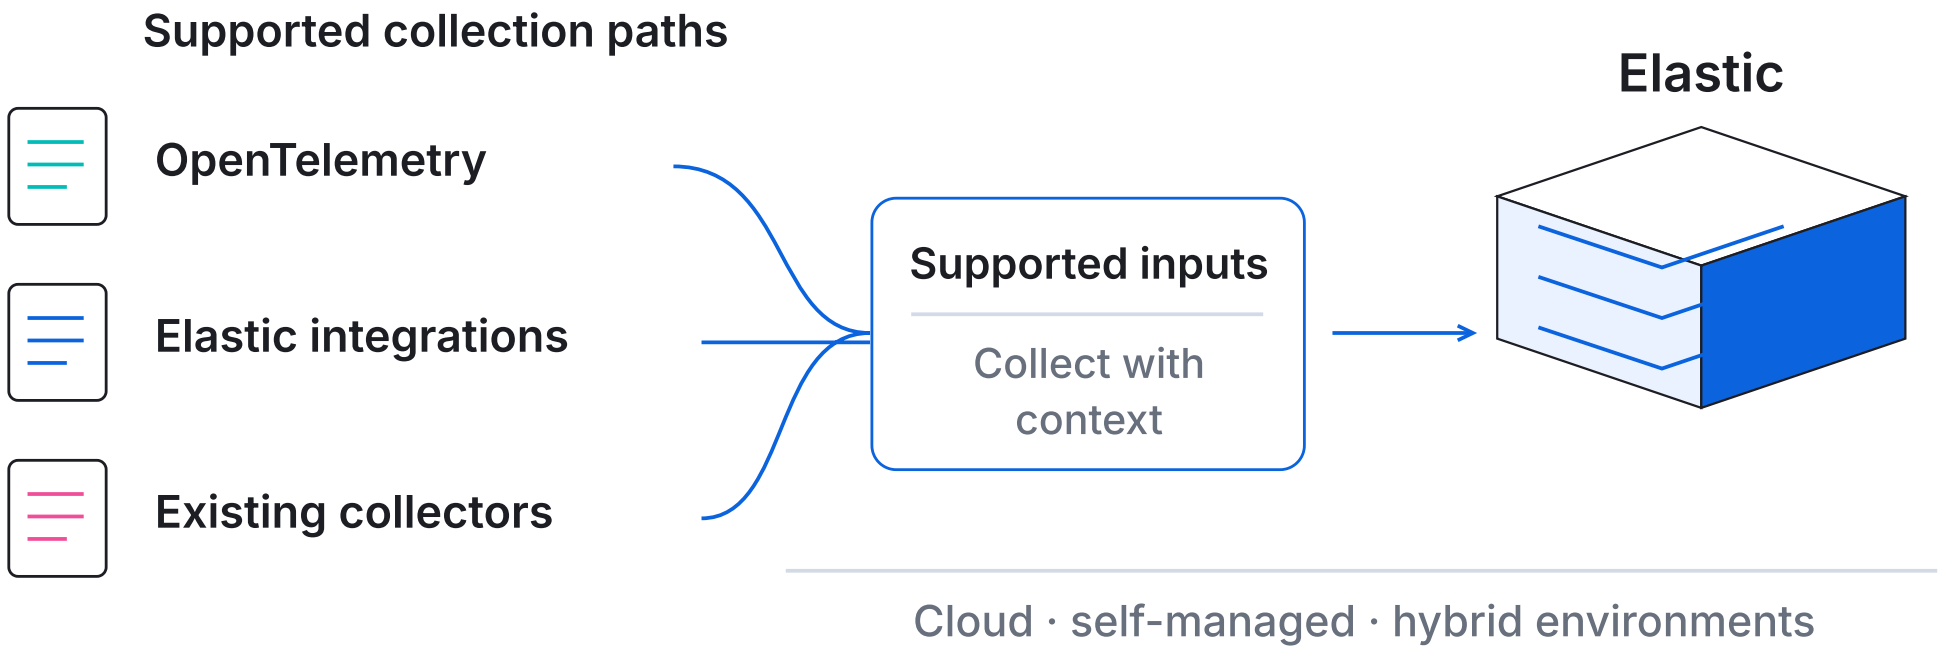

Keep investigating when the answer is outside the first chart.

ILLUSTRATIVE · NO LIVE SYSTEMS CONNECTED Illustrative investigation. Queries use available, permitted data; correlation does not establish cause.

PUBLIC SOURCES Elastic Observability overview ↗ Application and service monitoring ↗

Open collection. More choice.

Use OpenTelemetry and supported Elastic integrations across the environments you operate.

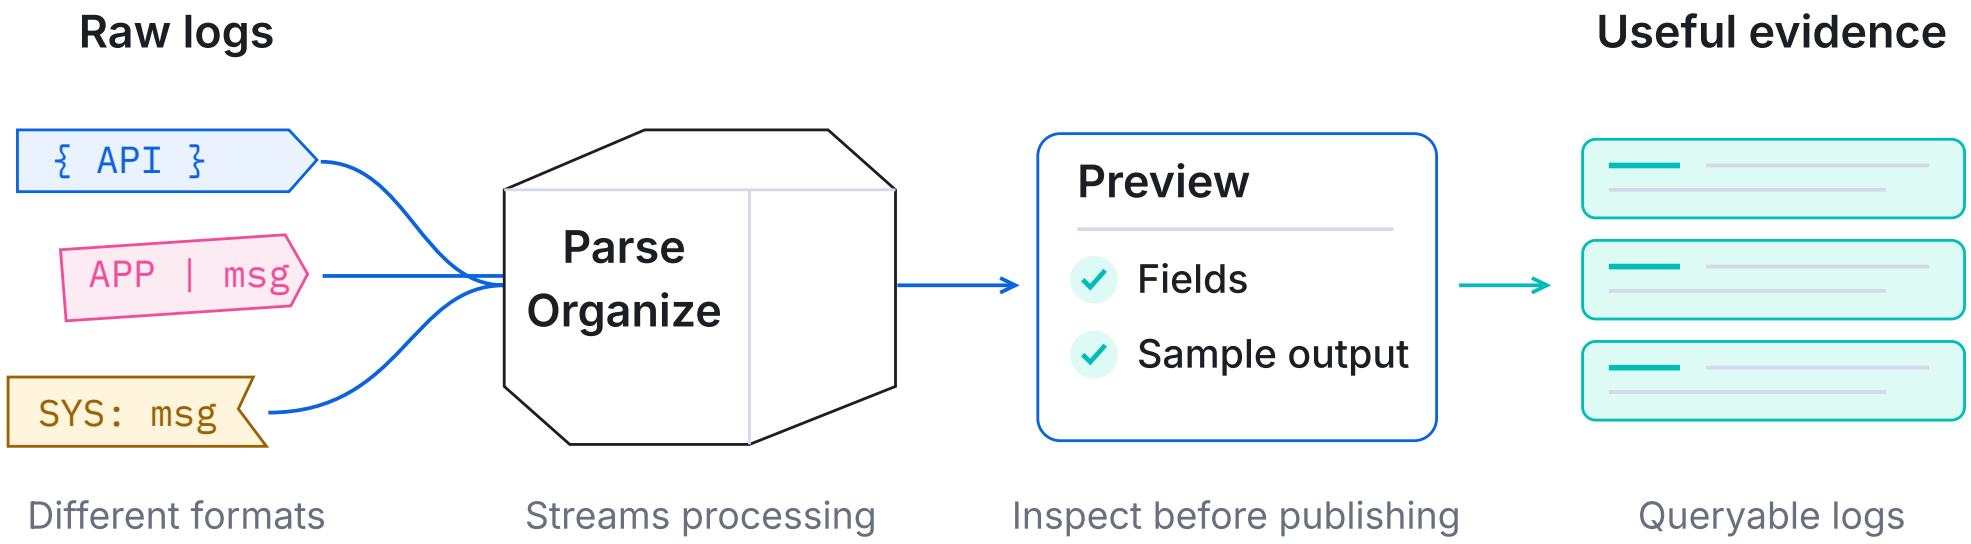

Keep collection choices open while bringing backend evidence into one investigation.

ELASTIC OBSERVABILITY Supported collection paths vary by signal, language, collector, release and deployment.

PUBLIC SOURCES OpenTelemetry with Elastic APM ↗ Elastic restricted-network collection ↗

Streams: make logs useful

Make useful log fields available before the next incident puts the team under pressure.

Move log preparation out of the incident's critical path.

ELASTIC OBSERVABILITY Streams management: Stack 9.2+. AI assistance needs an approved model and entitlement; features vary by version.

PUBLIC SOURCES Elastic Streams overview ↗ Process documents with Streams ↗ Streams data lifecycle ↗

Streams: make the waiting work visible

Turn API and worker logs into fields the incident owner can search and compare.

Synthetic log examples

API log

```
{"svc":"payment"}
```

Legacy log

```
PAY | WORKER | WAIT
```

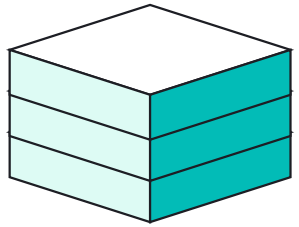

Different formats

Processing preview

Field	Sample
service	payment
component	worker
event	waiting

Validate the mapping

Search ready

Search by service and component

Event stays visible

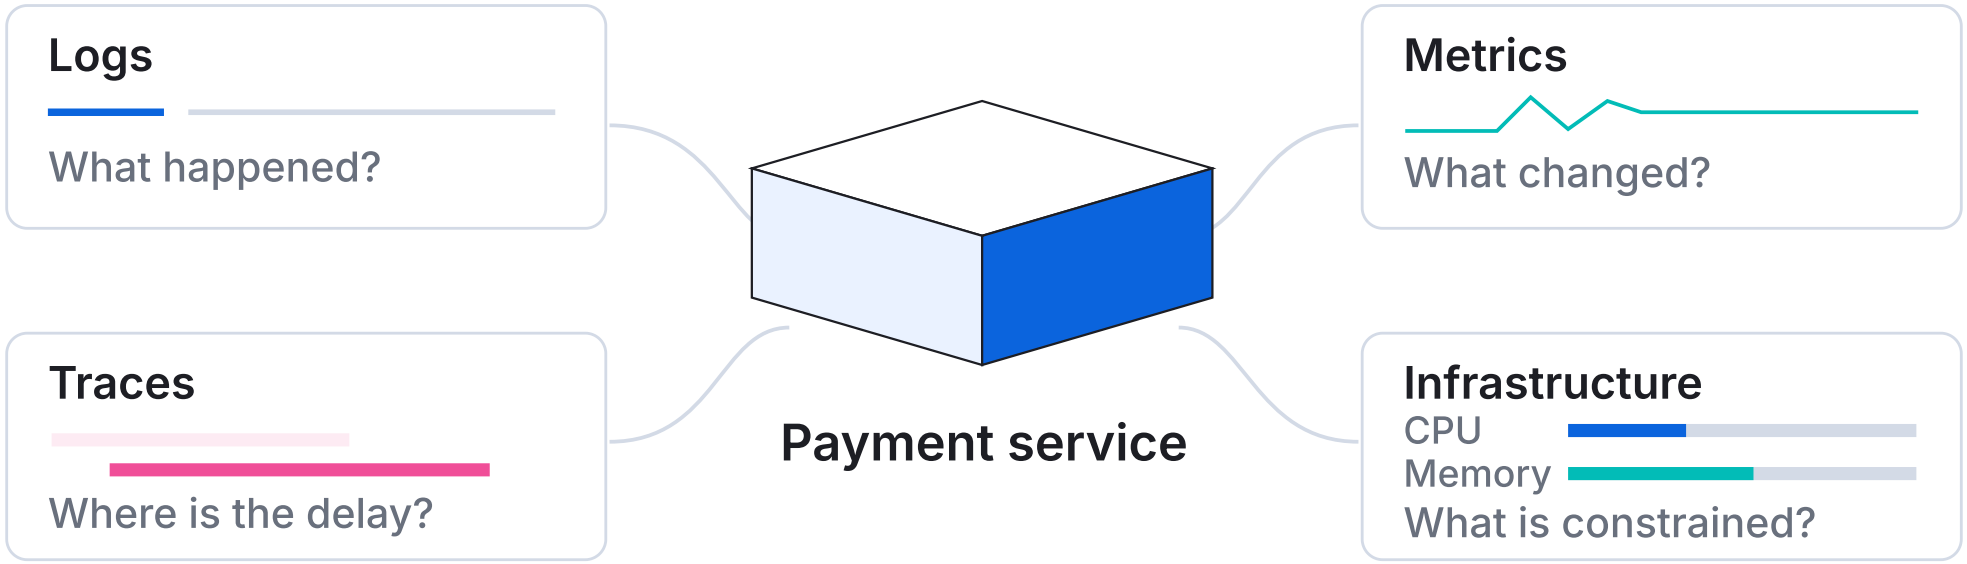

Find the payment worker's waiting events without decoding each log format again.

ILLUSTRATIVE · NO LIVE SYSTEMS CONNECTED Synthetic log-processing illustration. Field extraction is configured and reviewed; these are operational events.

PUBLIC SOURCES Process documents with Streams ↗ Elastic Streams overview ↗

Different clues. One investigation.

Connect logs, metrics and traces with the infrastructure context behind the payment service.

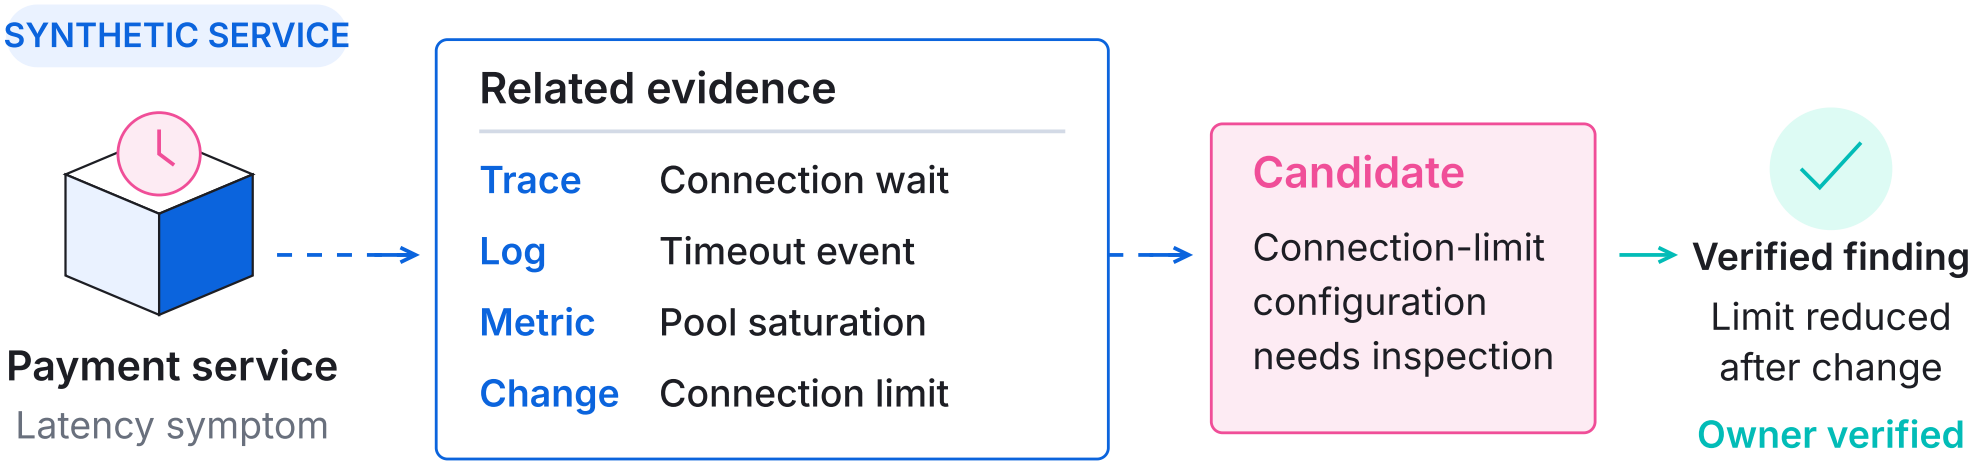

Follow the same service from the alert to the wait, the event and the resource condition.

ELASTIC OBSERVABILITY Coverage depends on instrumentation and shared context. Anomaly detection requires a supported configuration and subscription.

PUBLIC SOURCES Elastic Observability overview ↗ Application and service monitoring ↗ Infrastructure and host monitoring ↗

Find the wait. Verify the cause.

Connection waits, backlog growth and a recent configuration change point to one testable explanation.

Check configuration, infrastructure and dependencies before confirming the cause.
External-provider internals remain unobserved.

Give the incident owner a supported explanation—not another disconnected alert.

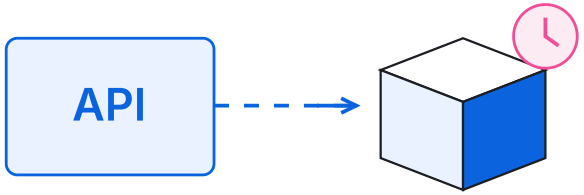

ILLUSTRATIVE · NO LIVE SYSTEMS CONNECTED Illustrative RCA. The owner verifies the actual setting and alternatives; uninstrumented provider internals remain unobserved.

PUBLIC SOURCES Application and service monitoring ↗ Elastic APM service maps ↗

Protect the workloads that keep banking moving

Apply the same investigation loop to payment APIs, messaging and batch processing.

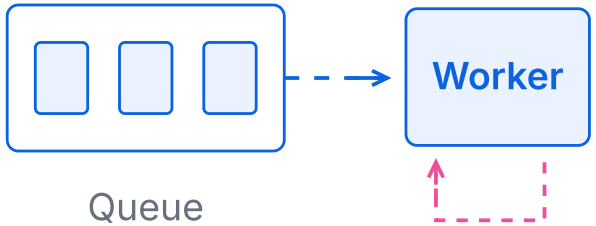

Payment APIs

Latency + errors

By service + dependency

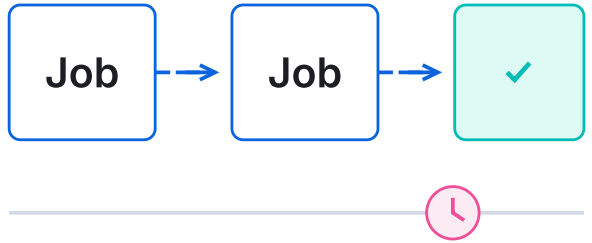

Messaging

Backlog + retries

Oldest-message age

Batch processing

Duration + failures

Deadline risk

PROPOSED INDICATORS Agree definitions and baselines with the bank.

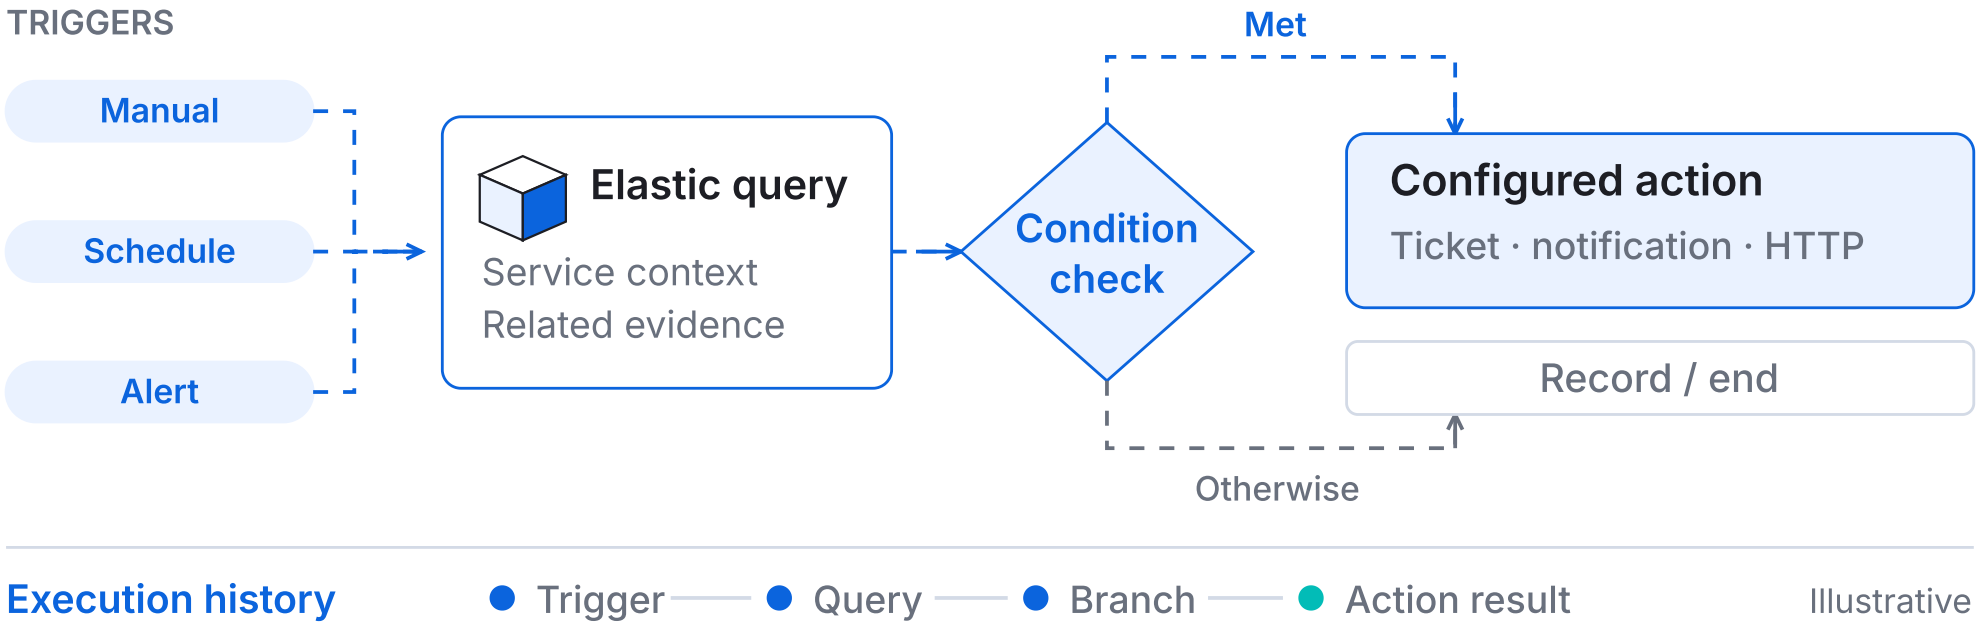

Know which workload is falling behind, where it is waiting and who owns the next move.

ILLUSTRATIVE · NO LIVE SYSTEMS CONNECTED Proposed backend use cases and indicators. Processing health does not prove settlement, balances or reconciliation.

PUBLIC SOURCES Elastic for financial services ↗ Application and service monitoring ↗ Infrastructure and host monitoring ↗

Workflows: turn insight into action

An authored sequence can query Elastic, apply conditions and coordinate the next steps.

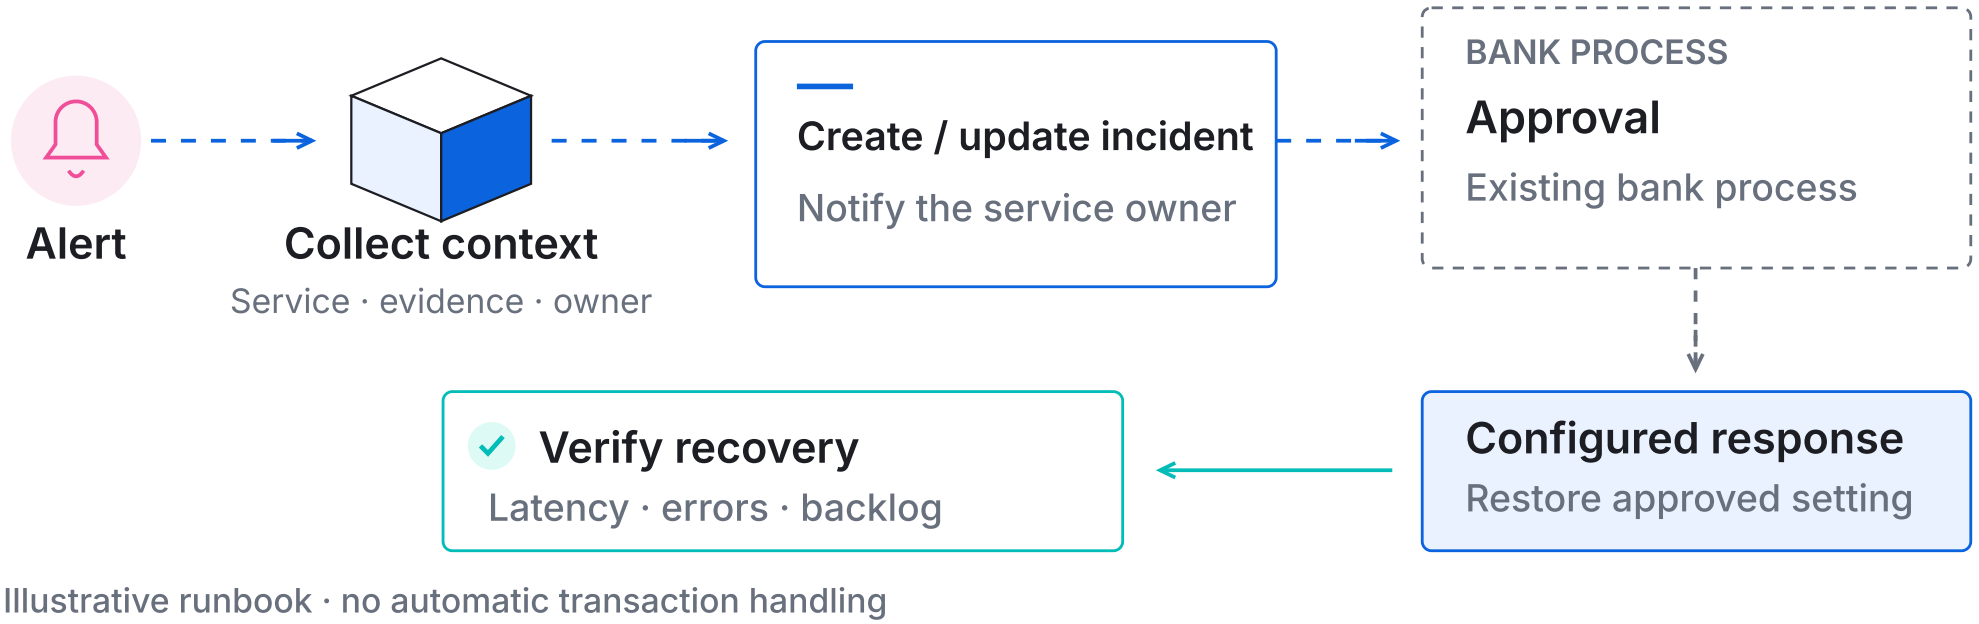

Carry the evidence into action instead of rebuilding it in the next tool.

ELASTIC OBSERVABILITY Workflows: Stack 9.4+ GA, Enterprise. Enable the feature; permissions, actions and external integrations must be configured.

PUBLIC SOURCES Elastic Workflows overview ↗ Set up Elastic Workflows ↗ Monitor workflow execution ↗

Workflows: a repeatable response

Package the payment-service evidence, route the incident and prepare an approved response.

Reduce repeated handoffs while keeping response authority with the bank.

ILLUSTRATIVE · NO LIVE SYSTEMS CONNECTED Illustrative authored runbook. Ticketing, notifications and approval use configured integrations or the bank's existing process.

PUBLIC SOURCES Observability workflow patterns ↗ Monitor workflow execution ↗ Set up Elastic Workflows ↗

Your infrastructure. Your operating model.

Run self-managed and keep the evidence needed to investigate recurring operational problems.

Retention, access and cost remain design choices.

Plan the approved AI model connection separately from on-premises data storage.

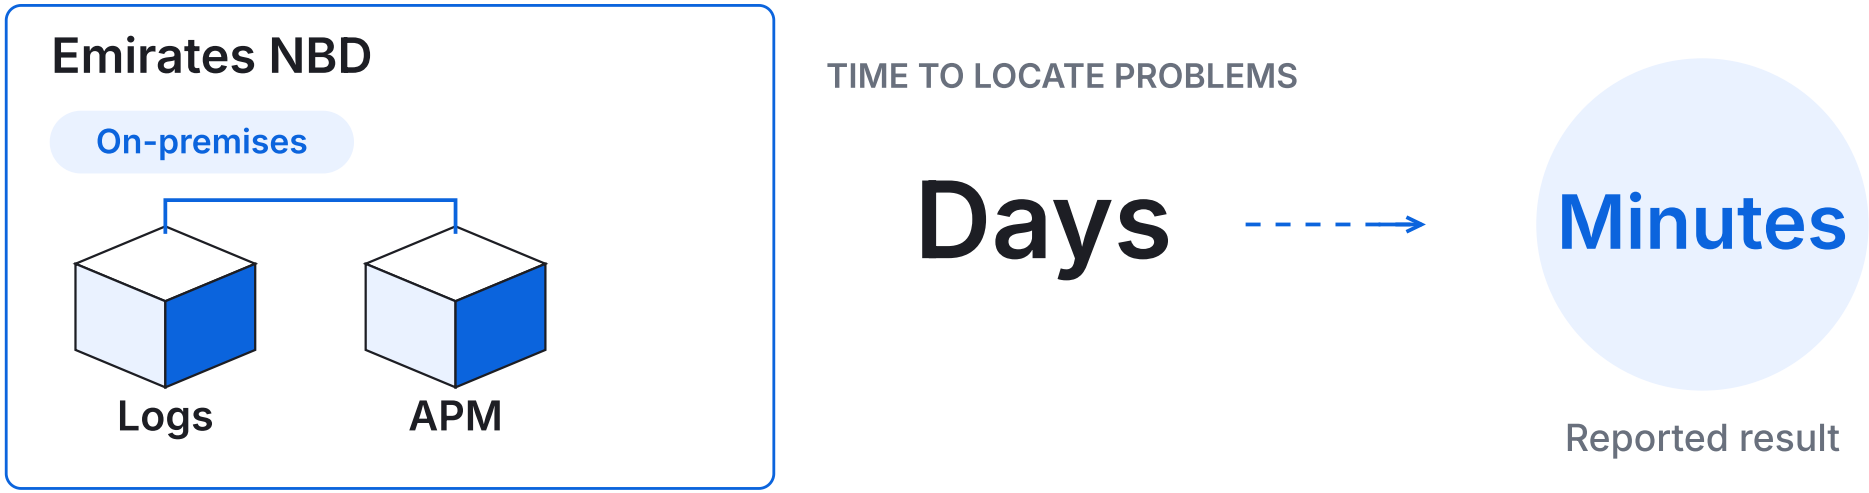

Choose the history you need, the controls you require and the operating tradeoffs you accept.

ELASTIC OBSERVABILITY Self-managed deployment is supported. Tiering, snapshots, licenses and approved data flows need design and validation.

Discover

Historical data retrieval

24+ hours → **Minutes**

ECE · AWS / S3

Public Elastic customer stories · distinct measures and environments

Reported outcomes predate the illustrated Streams and Workflows examples.

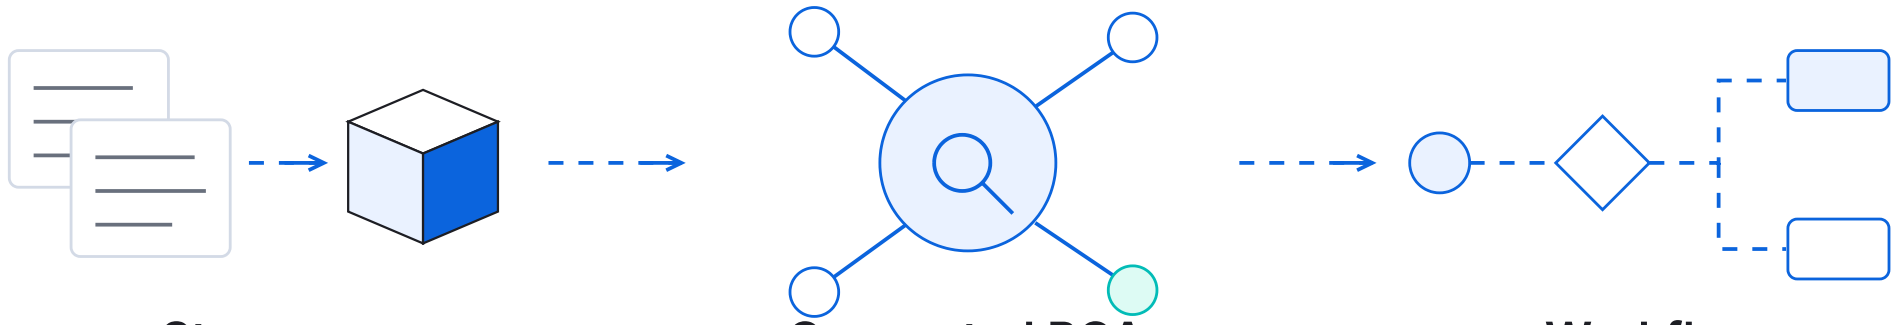

Improve the time to notice a problem and the ability to investigate what happened before.

CUSTOMER-REPORTED EXAMPLE Reported examples, not forecasts. Discover uses ECE with AWS and S3; it is not an on-premises reference.

PUBLIC SOURCES Oney Bank customer story ↗ Discover customer story ↗

From the first alert to a supported next move

Useful logs through Streams. A verified explanation. A repeatable response through Workflows.

Streams

Curate useful evidence

Connected RCA

Test the explanation

Workflows

Make action repeatable

Validate one payment-processing service · agree the evidence · choose the next step

Prove the connected loop on one payment-processing service.

ELASTIC OBSERVABILITY Proposed validation. Scope, access, version, subscription, baseline and response authority must be agreed.
