Reliable digital banking

How Elastic Observability connects customer experience with incident investigation.

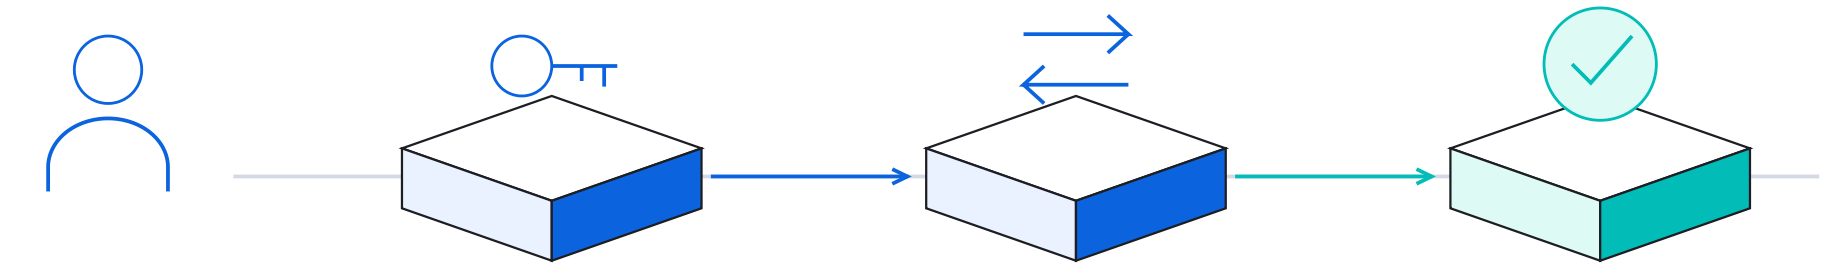

Start with the journey the customer needs to complete.

ILLUSTRATIVE · NO LIVE SYSTEMS CONNECTED Customer-neutral presentation. The transfer incident is fictional; no live bank data or transactions.

PUBLIC SOURCES Elastic Observability overview ↗

The customer promise

Access the account. Make the payment. Know what happened.

Define the outcome the customer can confirm

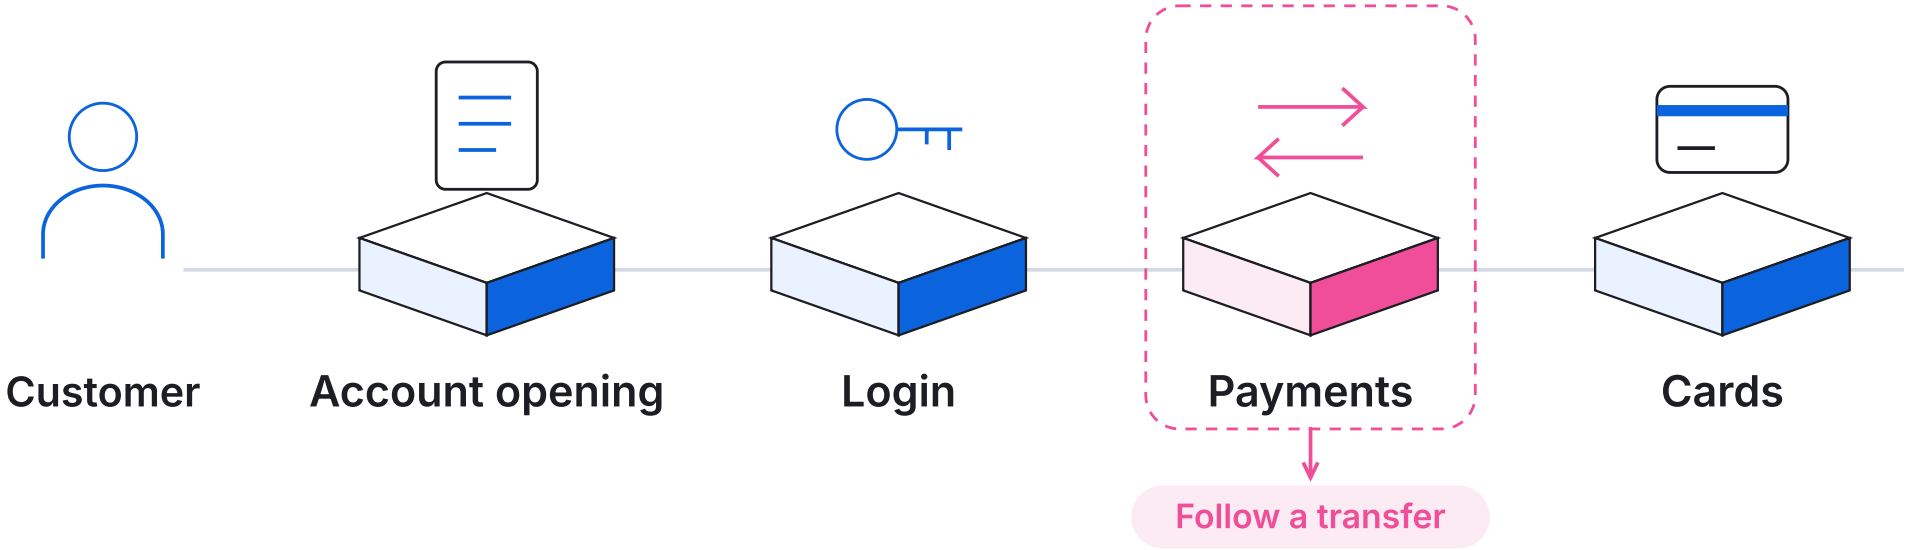

A healthy service matters when it supports a clear customer outcome.

ILLUSTRATIVE · NO LIVE SYSTEMS CONNECTED Illustrative outcomes. The bank defines success; an API response alone does not prove payment completion.

PUBLIC SOURCES Elastic Observability overview ↗ Elastic service-level objectives ↗

The journeys that matter

Account opening, login, payments and cards each need an agreed view of success.

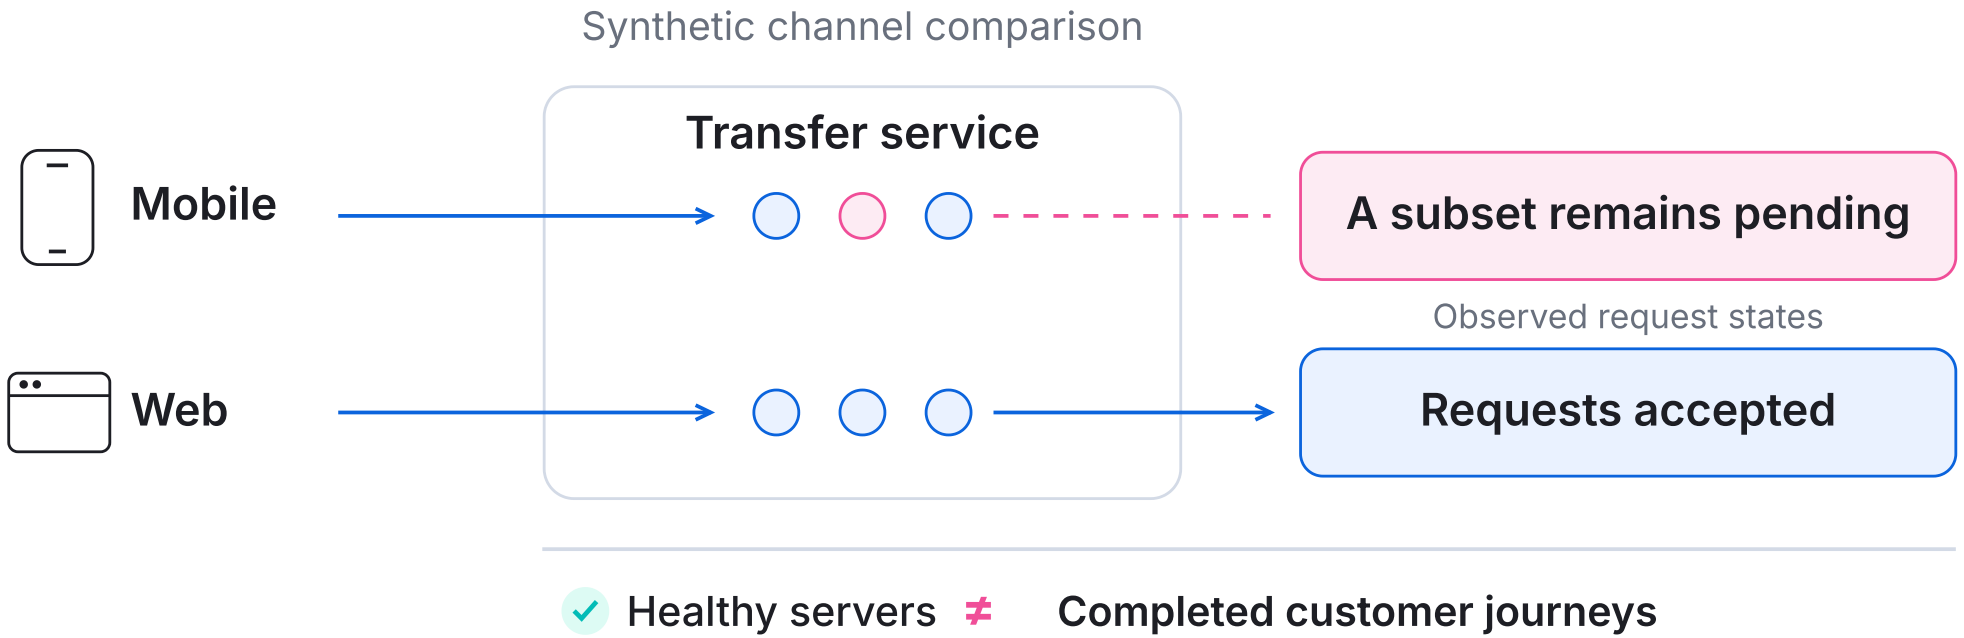

Begin with one journey whose outcome and owner are clear.

ILLUSTRATIVE · NO LIVE SYSTEMS CONNECTED Illustrative journey map. Coverage depends on permitted evidence and instrumentation.

PUBLIC SOURCES Elastic Observability overview ↗ Elastic APM service maps ↗

Which journey is affected?

A subset of mobile transfers is still pending. Compare channels and request states to establish impact.

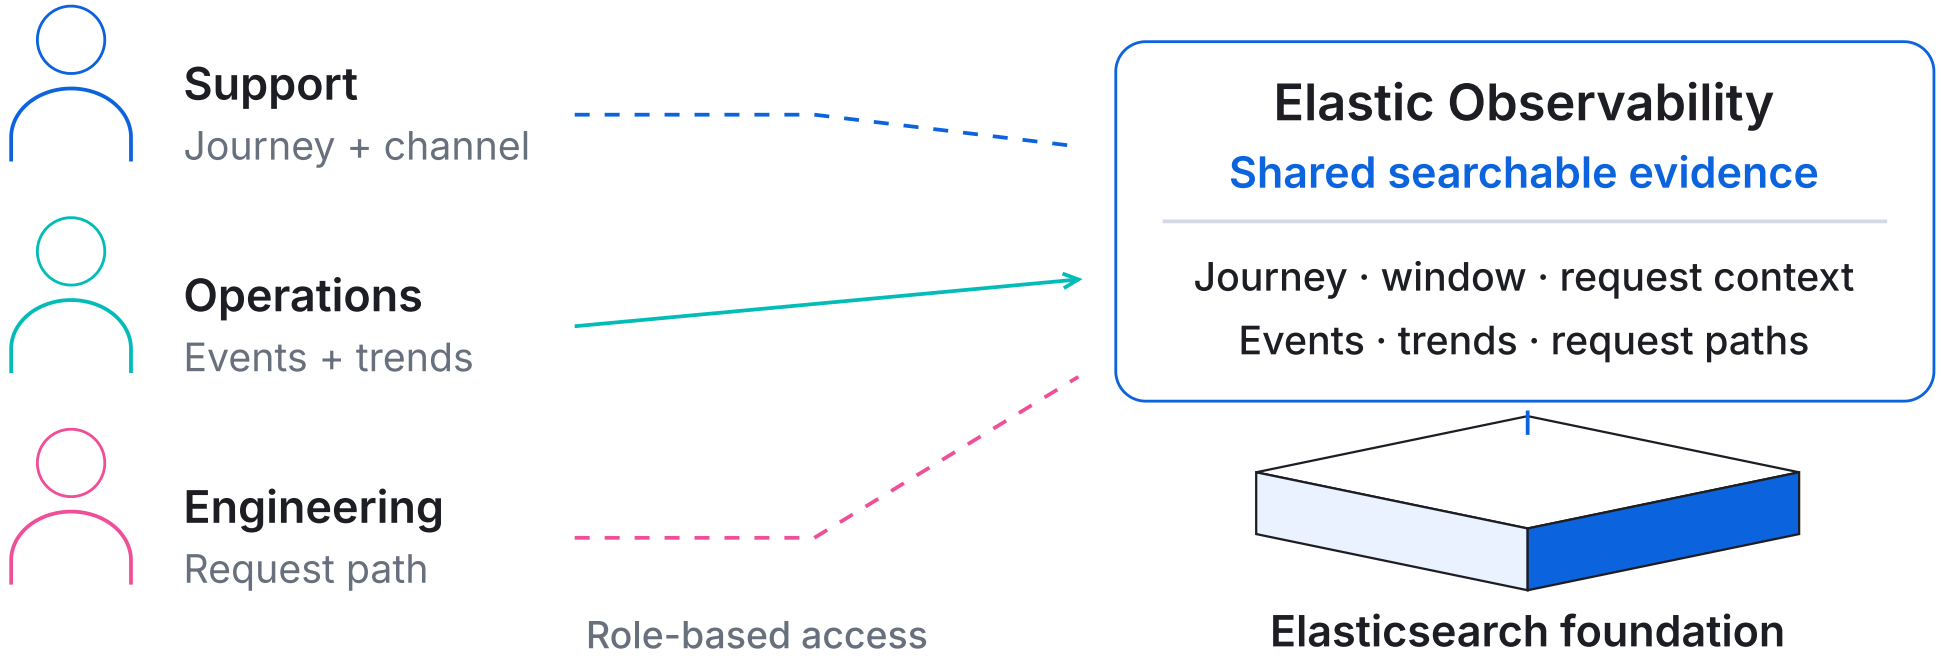

Customer impact needs journey evidence as well as service health.

ILLUSTRATIVE · NO LIVE SYSTEMS CONNECTED Synthetic incident. Pending does not mean failed; accepted does not prove downstream completion or settlement.

PUBLIC SOURCES Elastic Observability overview ↗ WePay customer story ↗

Evidence across teams

Elastic Observability connects permitted evidence in a shared, searchable investigation view.

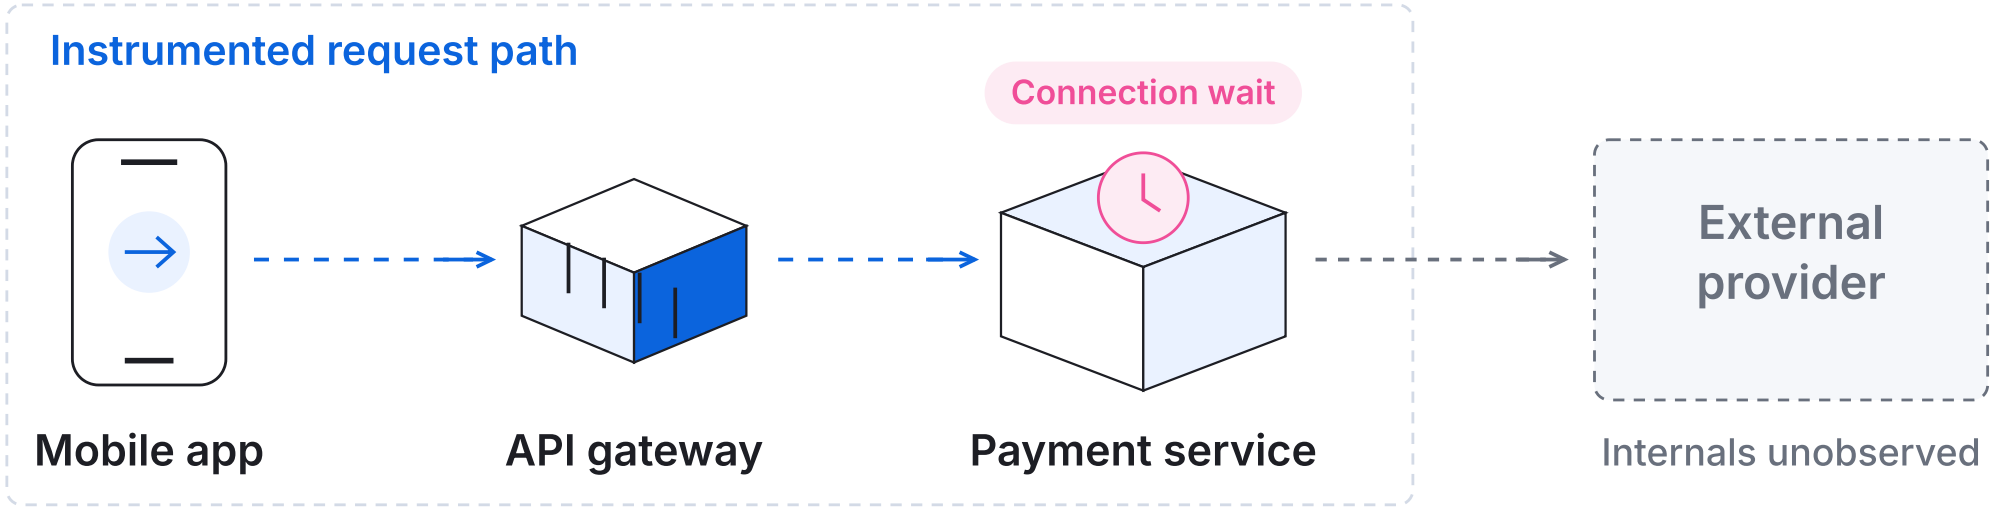

Give support, operations and engineering context they can search together.

ILLUSTRATIVE · NO LIVE SYSTEMS CONNECTED Coverage depends on collection, instrumentation, configuration and permissions; entitlement also applies.

PUBLIC SOURCES Elastic Observability overview ↗ Elastic APM service maps ↗ Elastic subscriptions ↗

The path of a transfer request

Follow the request through the gateway into the payment service.

Observed timing narrows the search. The owner still checks the cause.

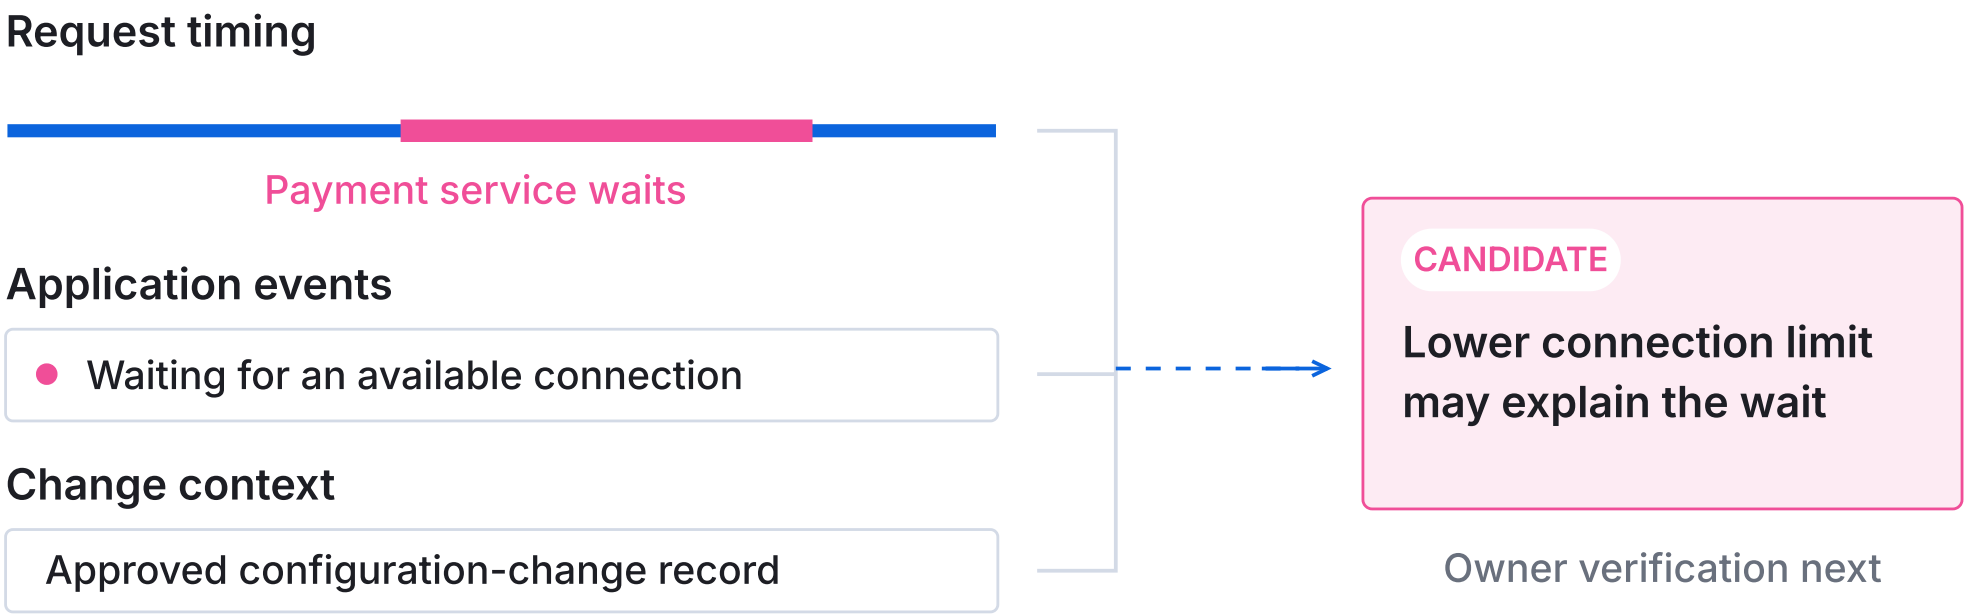

A request path helps locate delay within the observed boundary.

ILLUSTRATIVE · NO LIVE SYSTEMS CONNECTED Synthetic trace. Instrumentation and trace context define coverage; provider internals are unobserved.

PUBLIC SOURCES Elastic APM service maps ↗ Elastic Observability overview ↗

Evidence behind the delay

Request timing, connection-wait events and a configuration record point to a candidate explanation.

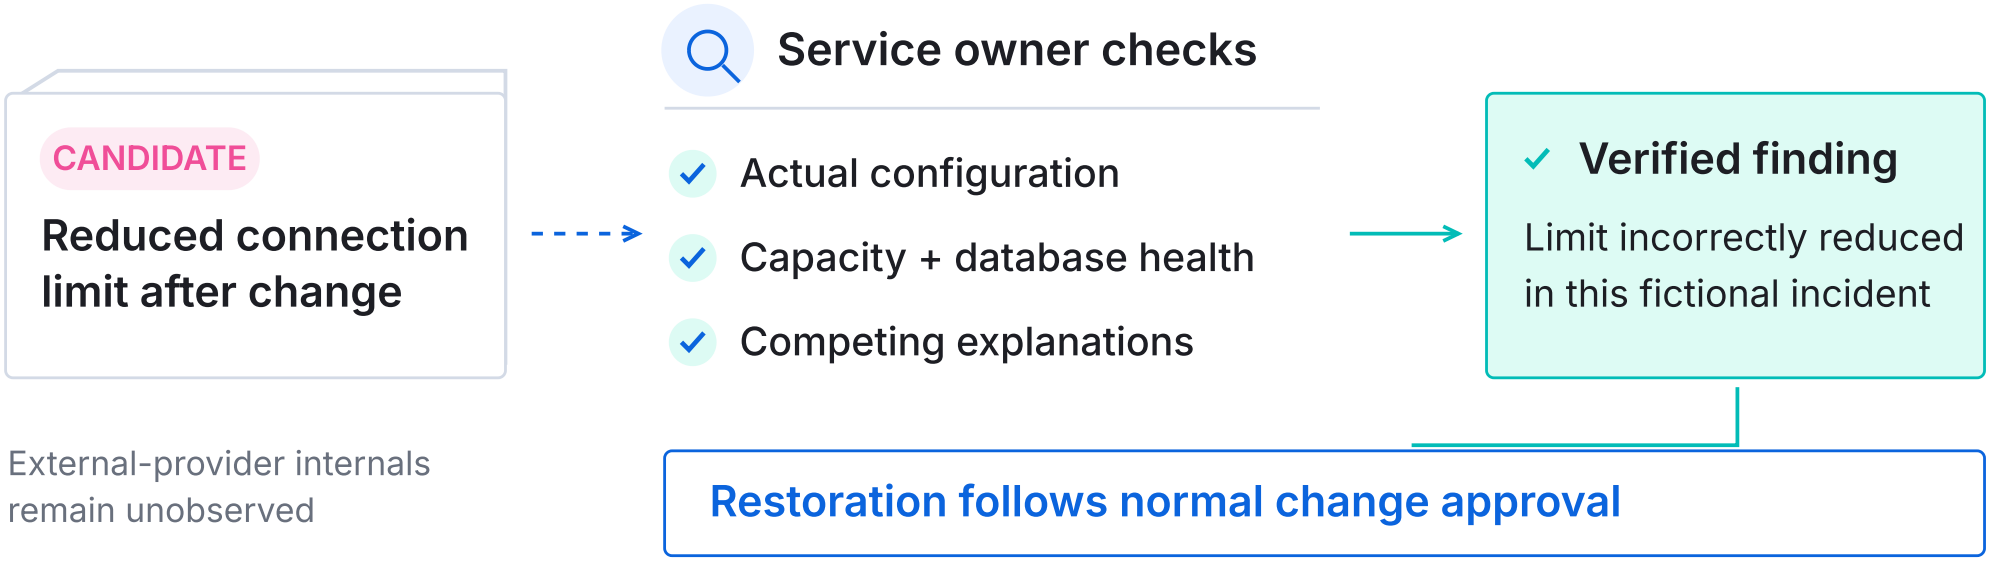

A plausible explanation is a question to check, not a verified cause.

ILLUSTRATIVE · NO LIVE SYSTEMS CONNECTED Synthetic evidence. Correlation and a slow trace alone do not establish causality.

PUBLIC SOURCES Elastic Observability overview ↗ Elastic APM service maps ↗

The owner verifies the cause

The owner checks the setting and competing explanations before confirming the finding.

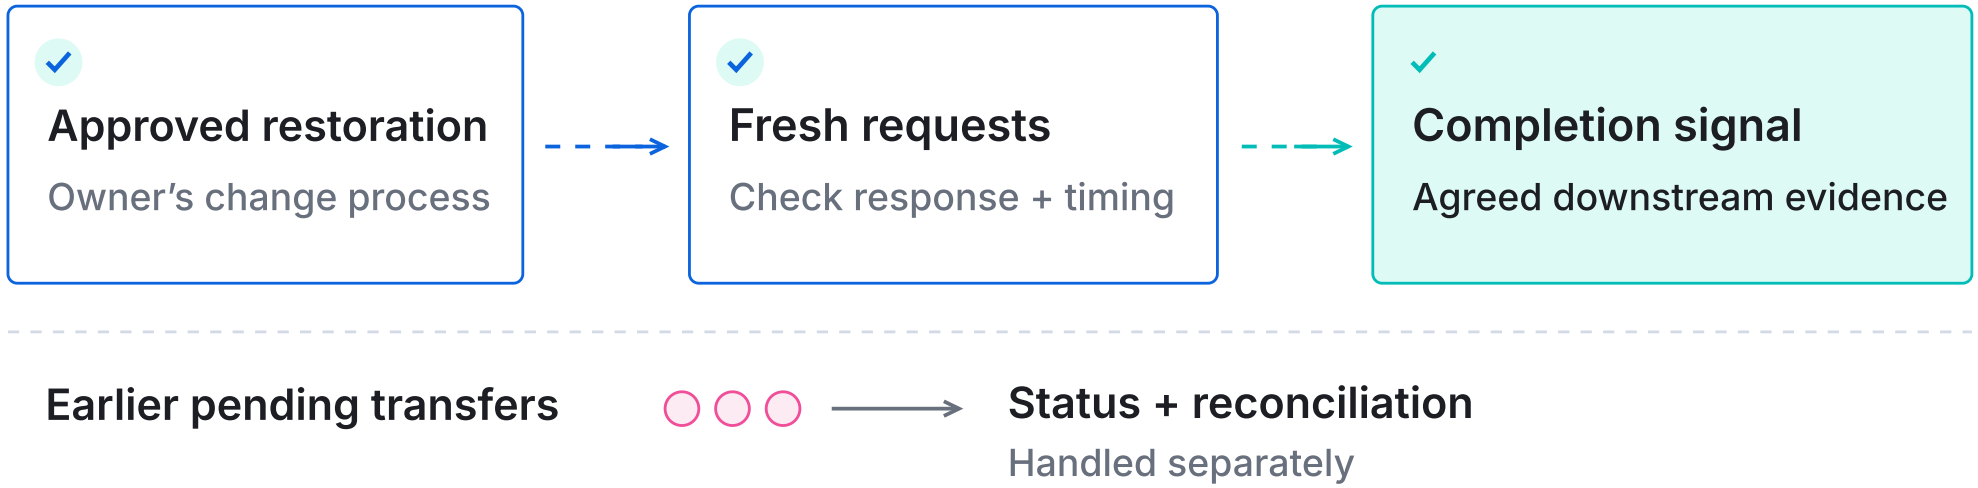

The fictional finding: an incorrectly reduced connection limit.

ILLUSTRATIVE · NO LIVE SYSTEMS CONNECTED Synthetic owner-verified finding. A chart or correlation alone does not prove a cause.

PUBLIC SOURCES Elastic Observability overview ↗ Elastic APM service maps ↗

Recovery the customer can confirm

Restore the approved setting, check fresh requests and verify the agreed downstream completion signal.

API success alone does not establish settlement or correct balances.

Fresh recovery checks and earlier pending transfers are separate work.

ILLUSTRATIVE · NO LIVE SYSTEMS CONNECTED Synthetic recovery. API success alone does not establish settlement or correct balances; reconcile earlier pending transfers.

PUBLIC SOURCES Elastic Observability overview ↗ Elastic service-level objectives ↗

Reliability targets for the journey

Define a good journey, then compare its evidence through demand and release changes.

Define the observed customer outcome

$$\frac{\text{Good eligible journeys}}{\text{All eligible journeys}} = \text{Journey indicator}$$

Target Agreed with the bank

Review window Agreed with the bank

Review the same journey around releases and changes.

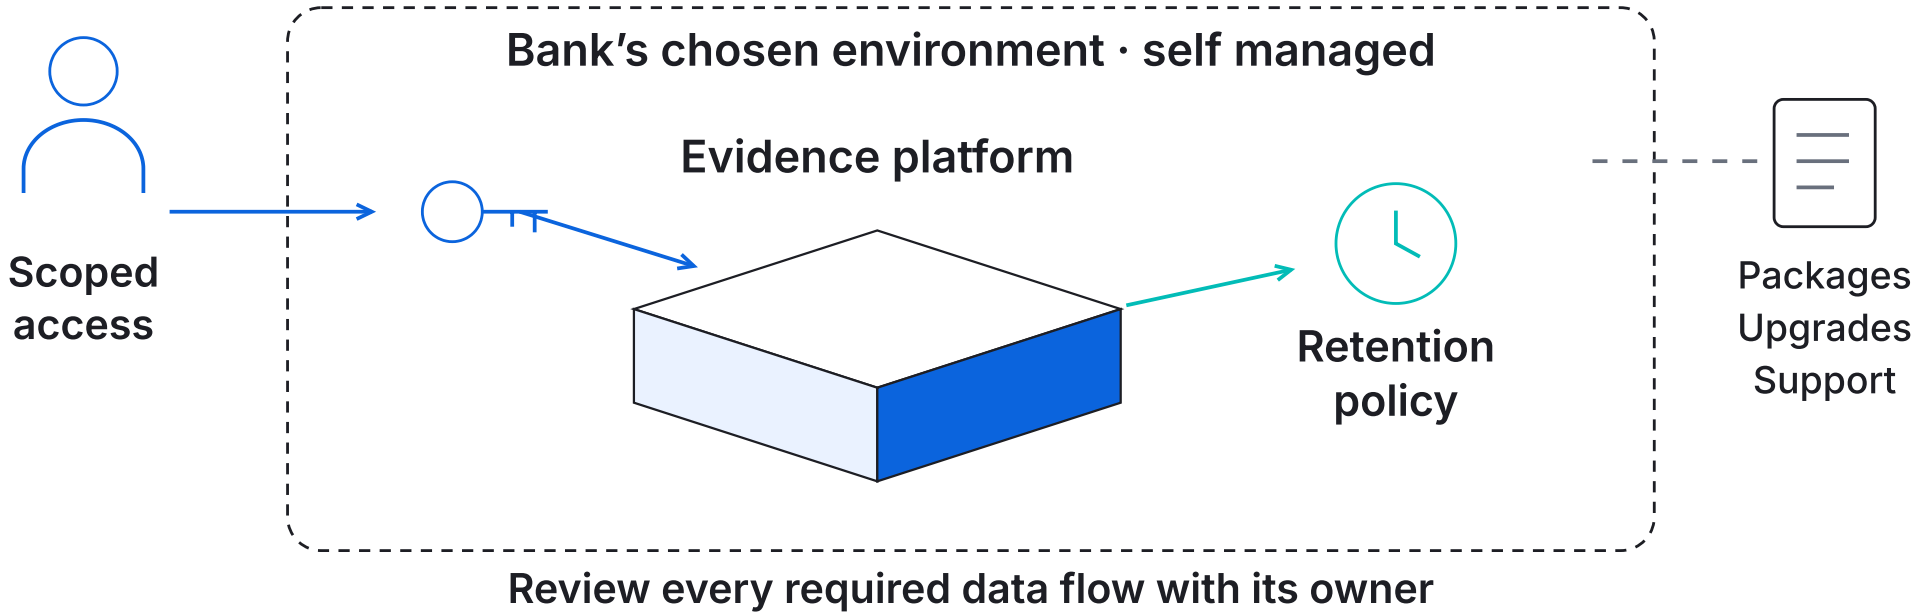

Choose a target that reflects the customer outcome you can observe.

ILLUSTRATIVE · NO LIVE SYSTEMS CONNECTED No target is prescribed. SLOs need entitlement and configuration; API success does not establish settled payments.

PUBLIC SOURCES Elastic service-level objectives ↗ Elastic subscriptions ↗

Control over the operating model

Self-managed operation can keep the evidence platform within the bank’s chosen environment.

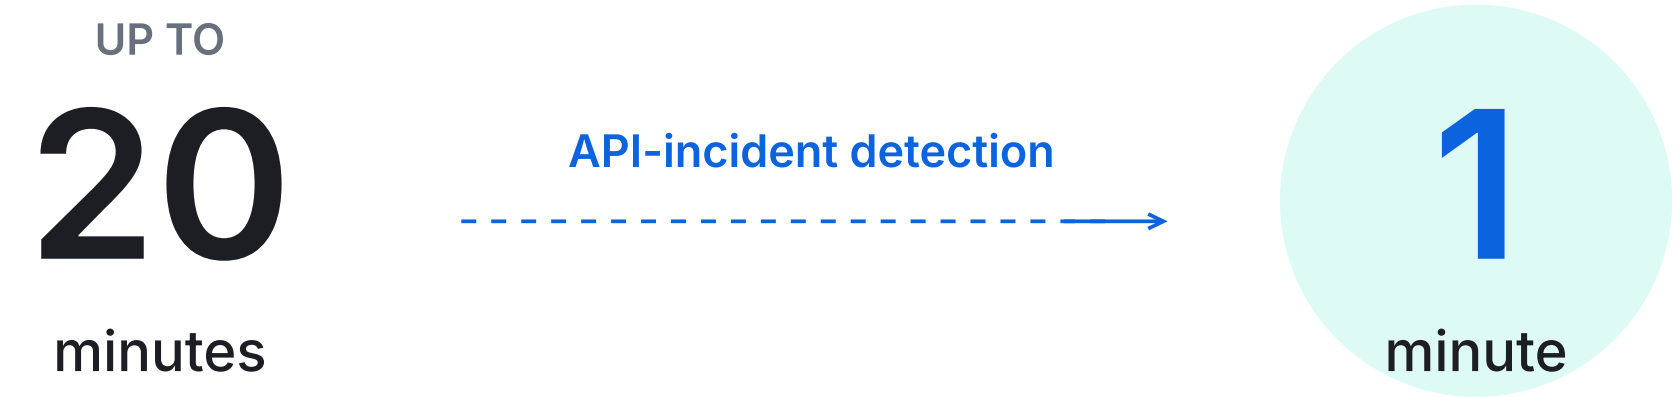

Agree access, retention, collection and every required data flow.

ILLUSTRATIVE · NO LIVE SYSTEMS CONNECTED Self-managed is an option, not a compliance assurance. Package, upgrade and support flows need review.

PUBLIC SOURCES Elastic restricted-network collection ↗ Elastic subscriptions ↗

Oney Bank: earlier detection

API-incident detection moved from up to 20 minutes to one minute.

Oney Bank · publicly reported customer result

Measure: time to detect API incidents

Measure the time to detect an incident separately from the time to resolve it.

CUSTOMER-REPORTED EXAMPLE Elastic-published customer result. Measure: API-incident detection, not resolution or MTTR. Results are not a forecast.

PUBLIC SOURCES Oney Bank customer story ↗

WePay: clearer customer impact

WePay reports 90% less time to identify customer impact during incidents.

90%

less time

TIME TO IDENTIFY

customer impact

during incidents

Shared logging + telemetry · Google Cloud

Elastic-published customer result

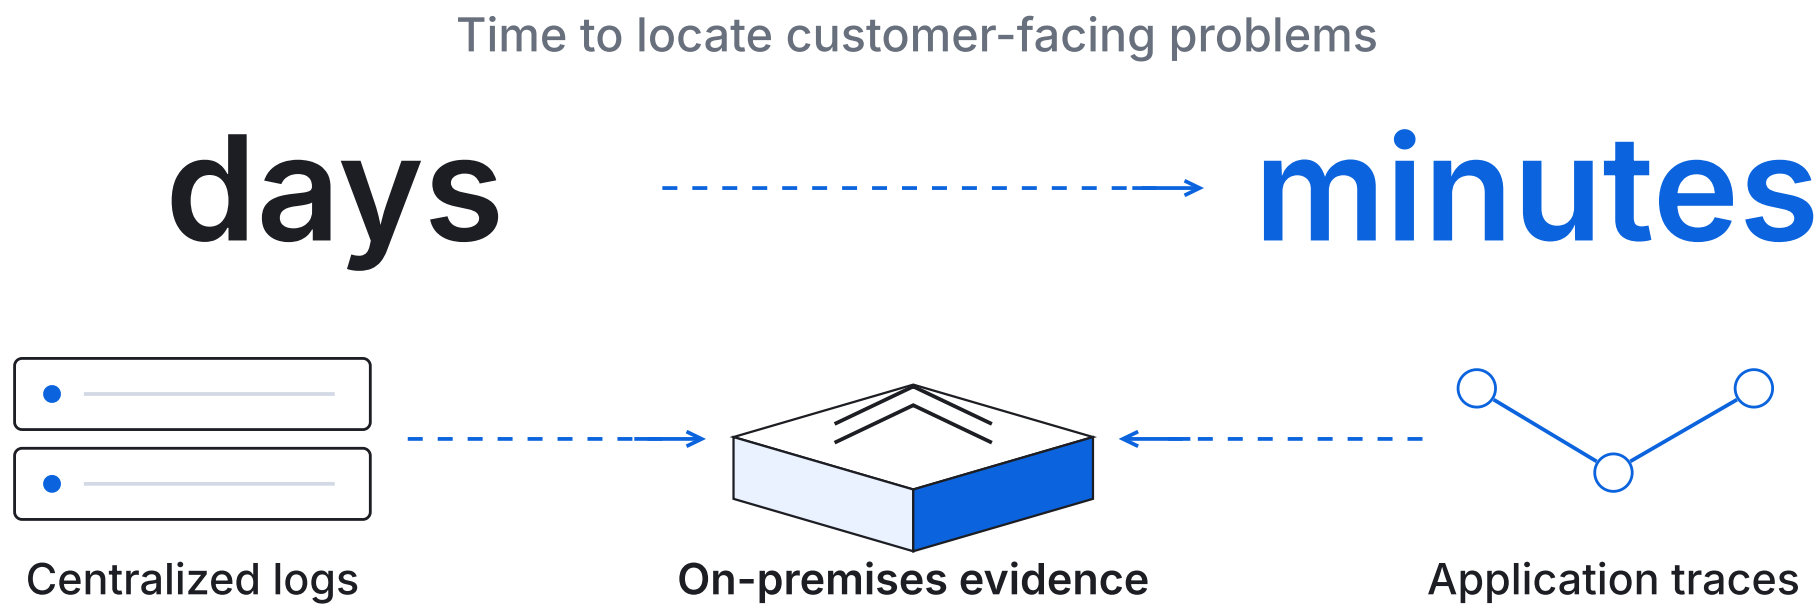

Faster impact identification helps teams agree who and what is affected.

CUSTOMER-REPORTED EXAMPLE Reported impact-identification result, not MTTR or downtime. Google Cloud context; APM was a future plan. No forecast.

PUBLIC SOURCES WePay customer story ↗

Emirates NBD: shared investigation

Centralized logs and APM support a reported shift from days to minutes to locate problems.

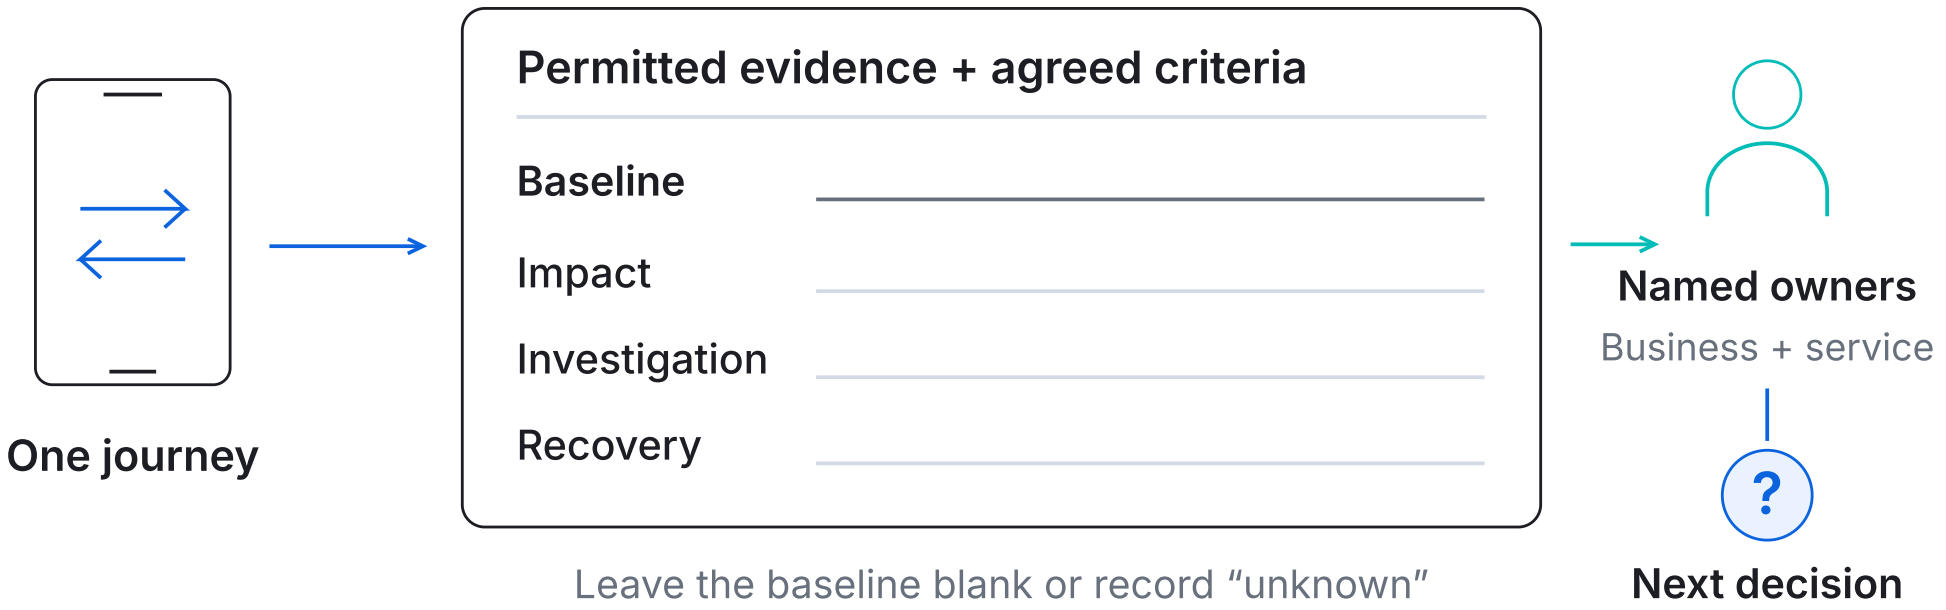

Shared evidence can help teams locate a customer-facing problem together.

CUSTOMER-REPORTED EXAMPLE Elastic-published account: days to minutes to locate problems. On-premises logs + APM; no Saudi-hosting or approval claim.

PUBLIC SOURCES Emirates NBD customer story ↗

One useful validation

Choose one journey, permitted evidence, a baseline or unknown, owners and a decision.

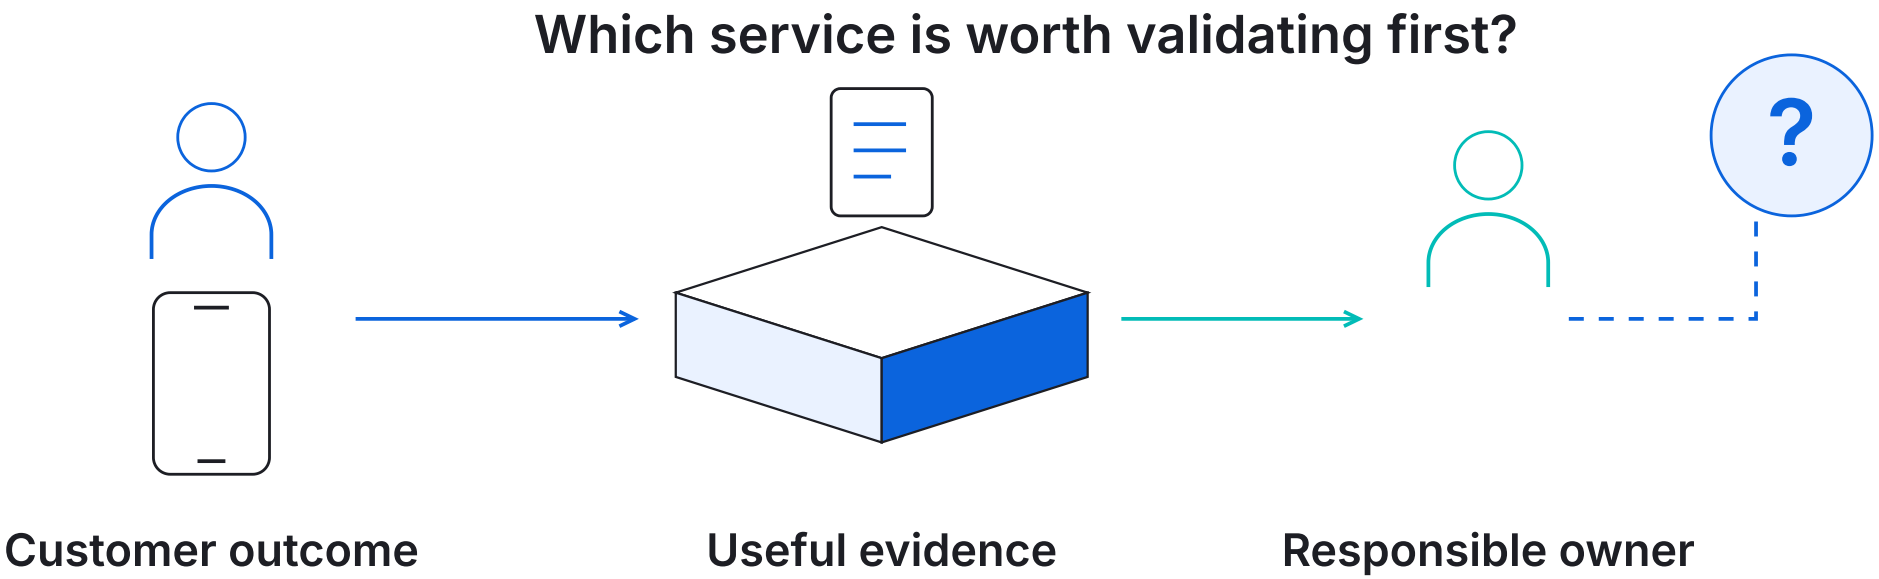

Finish with enough evidence to decide what should happen next.

ILLUSTRATIVE · NO LIVE SYSTEMS CONNECTED Proposed validation only. Scope, data permissions, owners, measures and success criteria must be agreed.

PUBLIC SOURCES Elastic Observability overview ↗ Elastic service-level objectives ↗ Elastic subscriptions ↗

Which journey should we validate?

Connect customer experience, shared evidence and an owner's next decision.

Choose one service worth understanding better.

ILLUSTRATIVE · NO LIVE SYSTEMS CONNECTED Discussion proposal. The incident was fictional; any validation uses agreed scope, permissions and success measures.
