Elastic Observability

Connect your data. Understand what matters.
Make action repeatable.

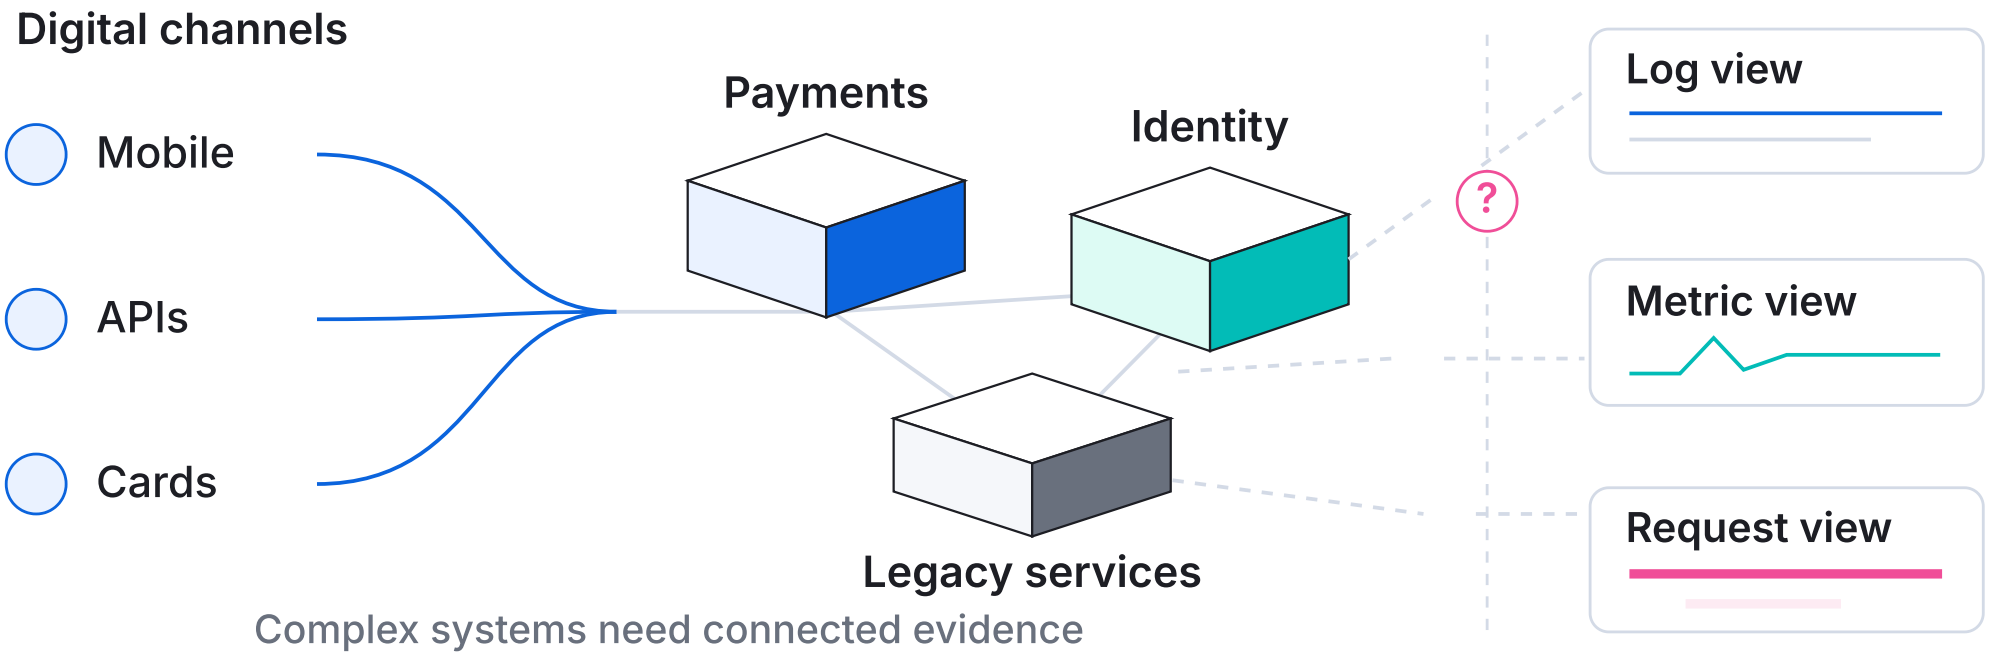

From scattered telemetry to answers and action—on your terms.

ELASTIC OBSERVABILITY Original illustrations. Product availability depends on the deployed release and subscription.

PUBLIC SOURCES Elastic Observability overview ↗ Elastic Streams overview ↗ Elastic Workflows overview ↗

A connected bank needs connected answers

One customer experience can cross mobile apps, APIs, payment services and legacy systems.

Complex systems need connected evidence

More telemetry only helps when teams can connect it.

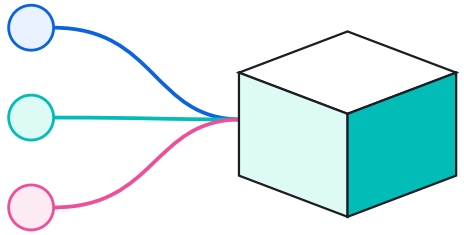

ILLUSTRATIVE · NO LIVE SYSTEMS CONNECTED Illustrative bank architecture. Actual systems and telemetry coverage must be established.

PUBLIC SOURCES Elastic Observability overview ↗ Elastic for financial services ↗

Open. Connected. Actionable.

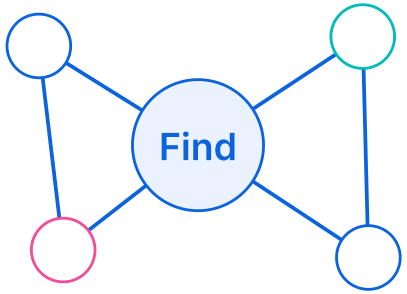

Bring data in openly, preserve its context, and turn useful findings into repeatable action.

Open

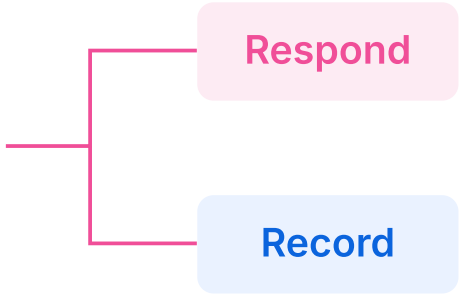

Collect with choice

Connected

Investigate in context

Actionable

Repeat useful actions

One search foundation connects the loop

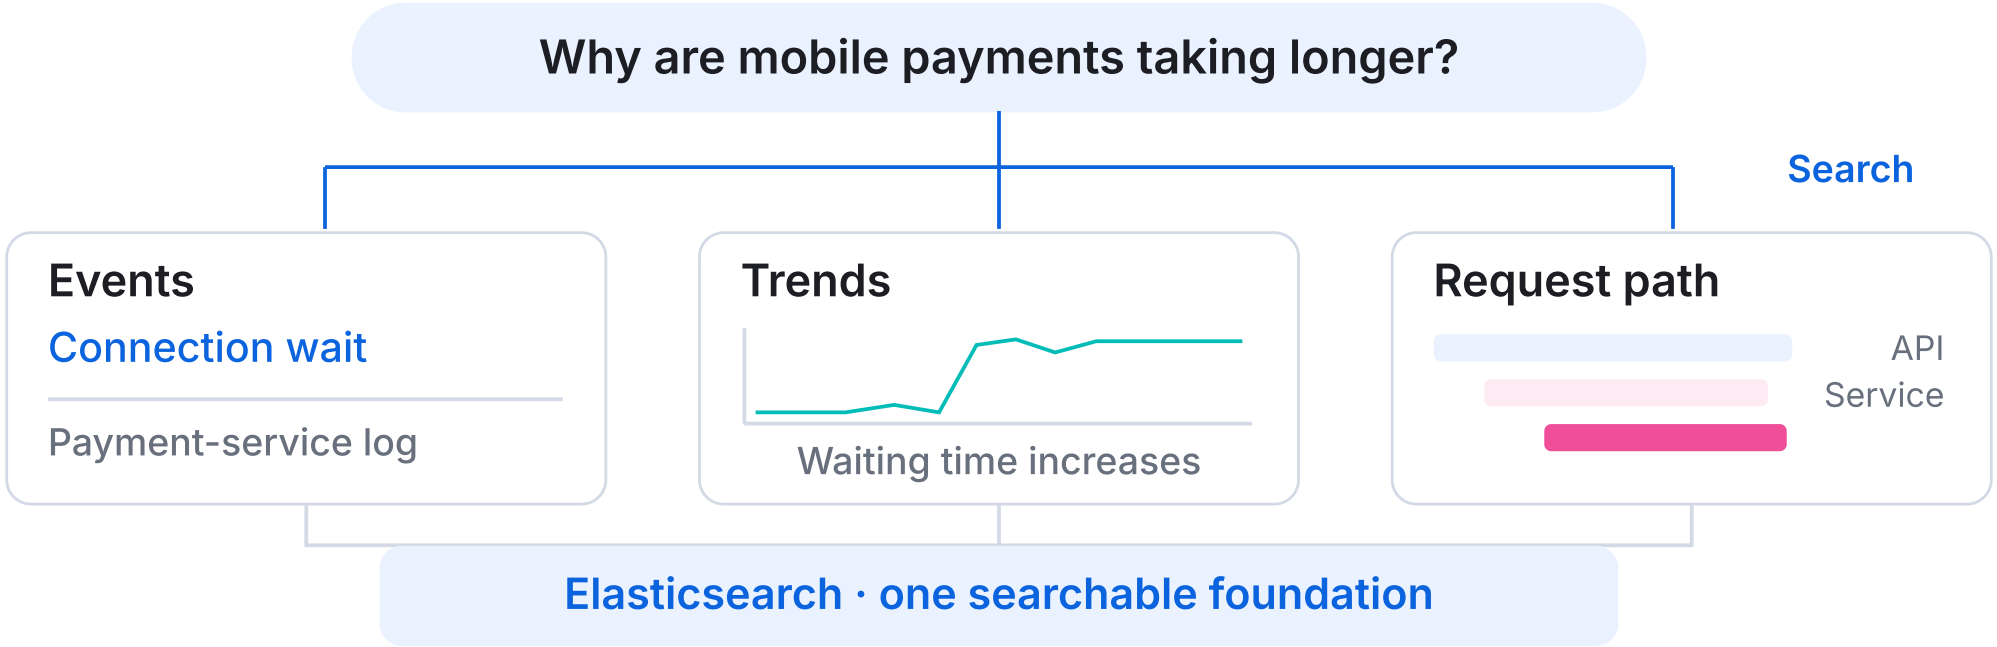

Streams prepares the evidence. Investigation connects it. Workflows puts it to work.

ELASTIC OBSERVABILITY Architecture overview. Collection, correlation and automation require configuration and appropriate access.

PUBLIC SOURCES Elastic Observability overview ↗ Elastic Streams overview ↗ Elastic Workflows overview ↗

Search beyond the dashboard

Ask a new question across events, service behavior and request context—not just a prebuilt chart.

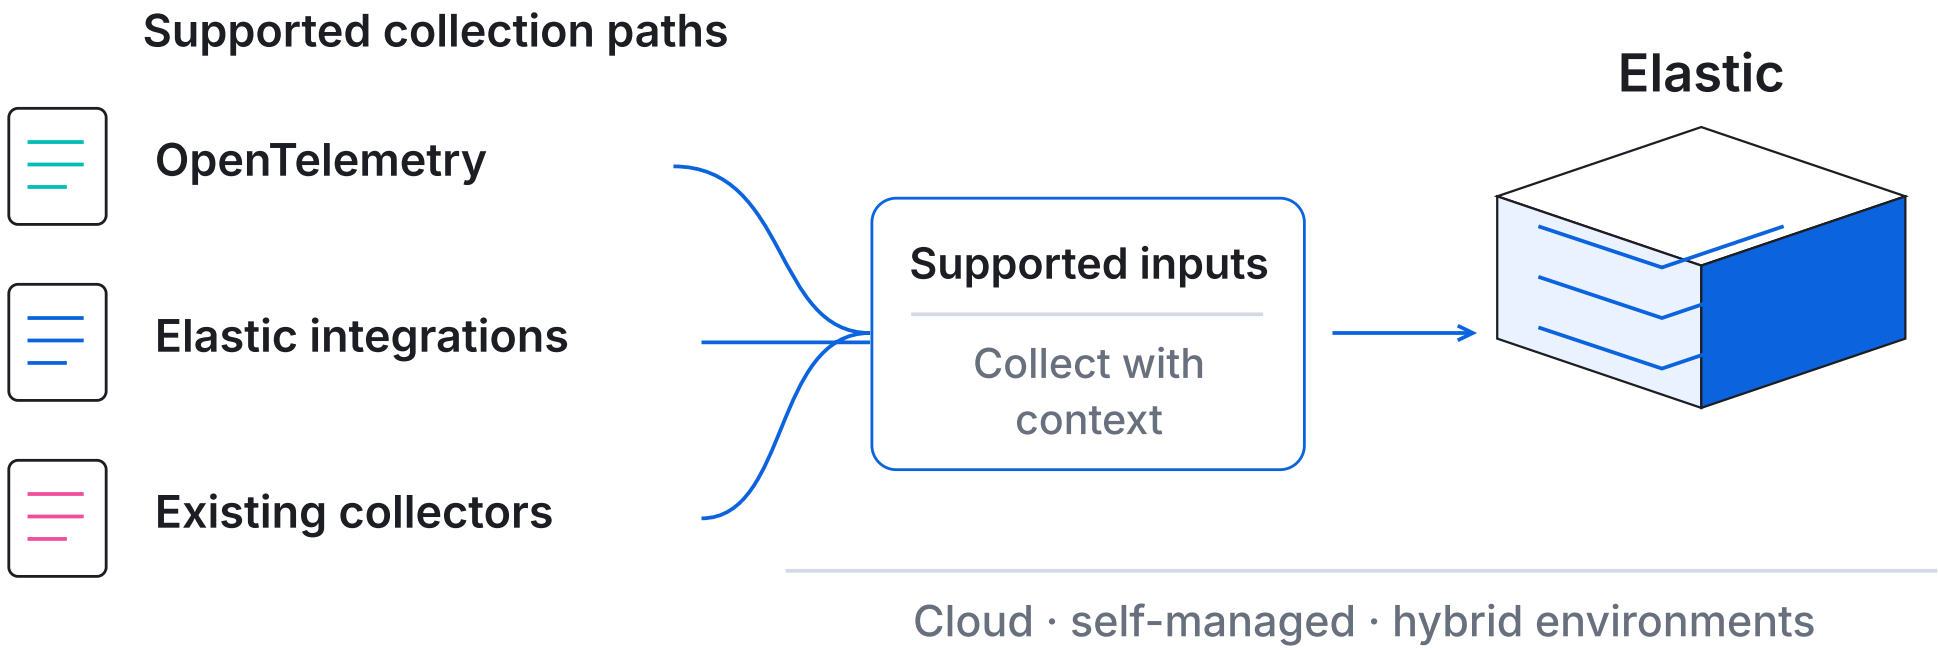

The next question does not have to be the one the dashboard designer anticipated.

ILLUSTRATIVE · NO LIVE SYSTEMS CONNECTED Illustrative investigation. Queries use available, permitted data; correlation does not establish cause.

PUBLIC SOURCES Elastic Observability overview ↗ Application and service monitoring ↗

Open collection. More choice.

Use OpenTelemetry and supported Elastic integrations across the environments you operate.

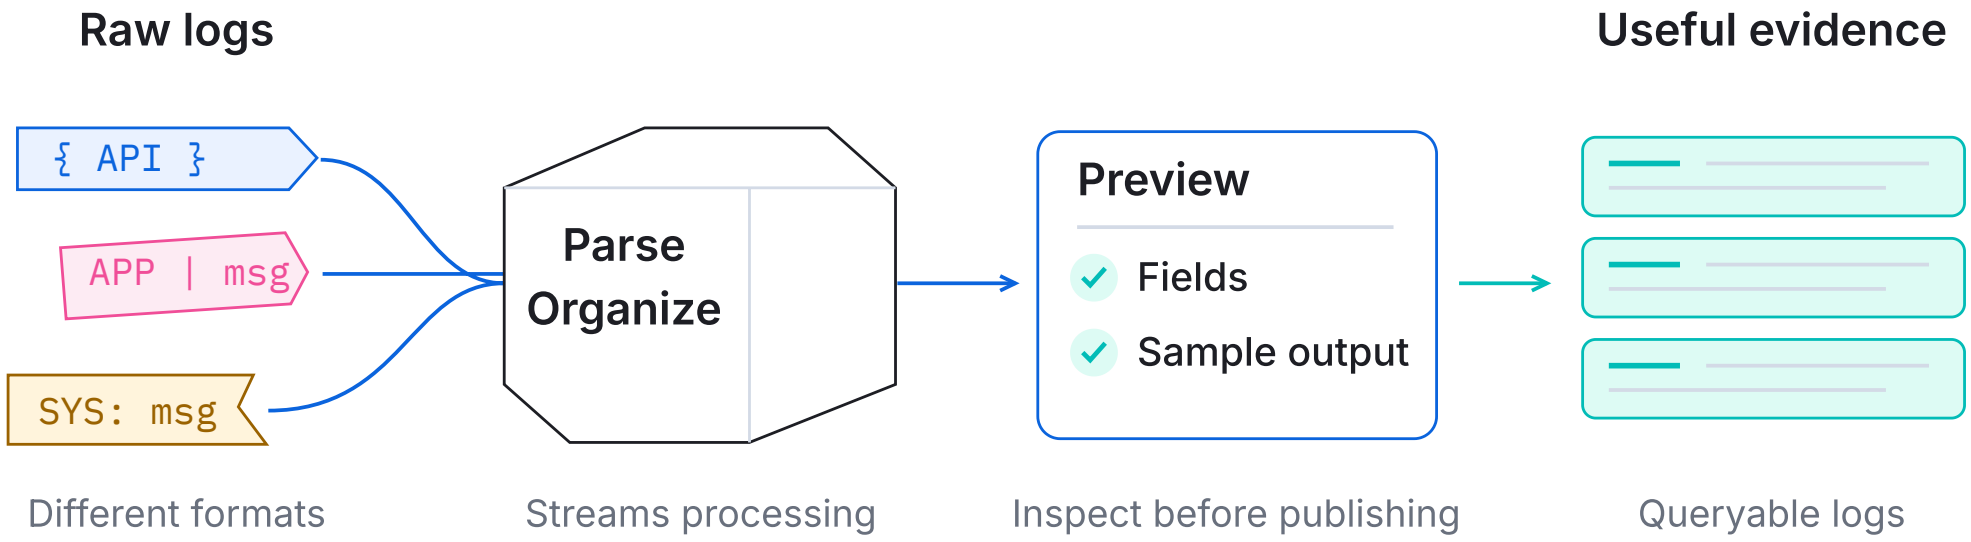

Start with useful data and supported collectors; expand as the bank sees value.

ELASTIC OBSERVABILITY Supported collection paths vary by signal, language, collector, release and deployment.

PUBLIC SOURCES OpenTelemetry with Elastic APM ↗ Elastic restricted-network collection ↗

Streams: make logs useful

A guided place to process, inspect and manage the logs your teams depend on.

Spend less effort reconstructing log meaning before the investigation can begin.

ELASTIC OBSERVABILITY Streams management: Stack 9.2+. AI assistance needs an approved model and entitlement; features vary by version.

PUBLIC SOURCES Elastic Streams overview ↗ Process documents with Streams ↗ Streams data lifecycle ↗

Streams: from raw logs to answers

Make API and legacy payment events understandable through useful, consistent fields.

Synthetic log examples

API log

```
{"svc":"payment"}
```

Legacy log

```
PAY | MOB | WAIT
```

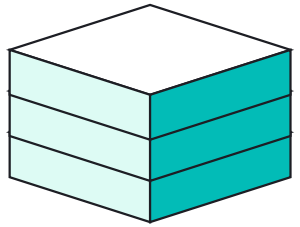

Different formats

Processing preview

Field	Sample
service	payment
channel	mobile
outcome	waiting

Validate the mapping

Search ready

Search by service and channel

Outcome stays visible

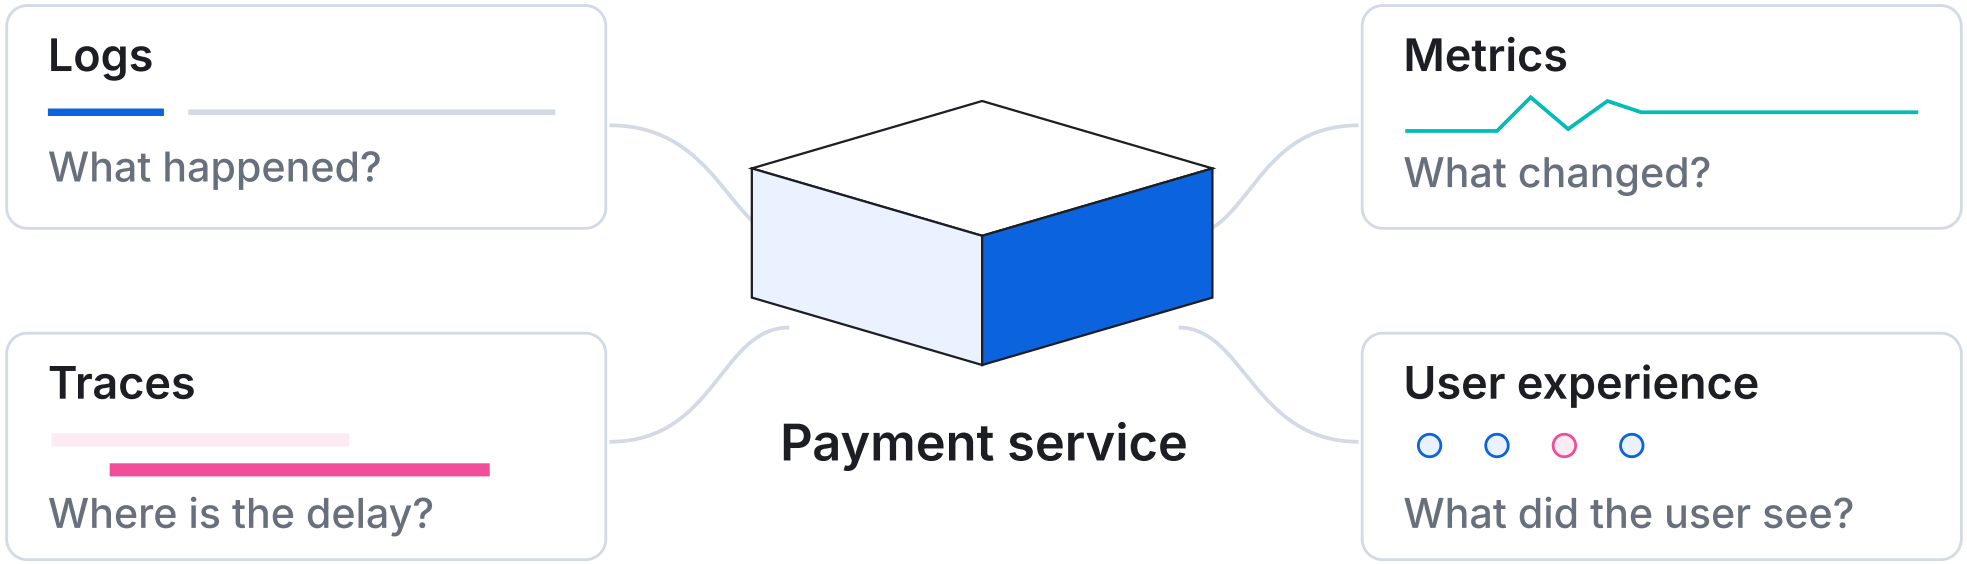

Ask about the payment service and outcome, rather than decode a different log format each time.

ILLUSTRATIVE · NO LIVE SYSTEMS CONNECTED Synthetic log-processing illustration. Parsing is configured and reviewed; request status is not payment settlement.

PUBLIC SOURCES Process documents with Streams ↗ Elastic Streams overview ↗

One service. Connected signals.

Logs, metrics, traces and user experience answer different parts of the same question.

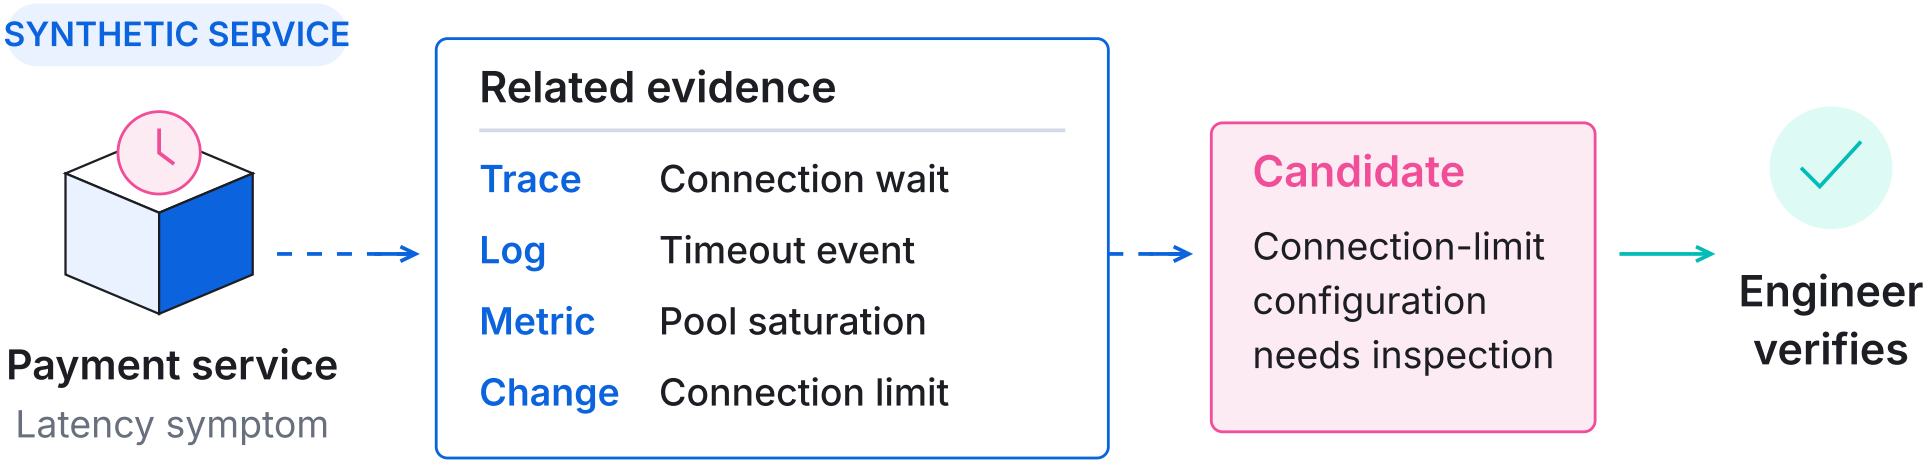

Move from a symptom to its supporting evidence while keeping the service in context.

ELASTIC OBSERVABILITY Coverage depends on instrumentation and shared context. Anomaly detection requires a supported configuration and subscription.

PUBLIC SOURCES Elastic Observability overview ↗ Application and service monitoring ↗ Machine learning anomaly detection ↗

RCA: follow the evidence

Connect service degradation, request timing, log events and change context in one investigation.

A candidate is tested against actual configuration and competing explanations.
External-provider internals remain unobserved.

Elastic narrows the search. The service owner verifies the explanation.

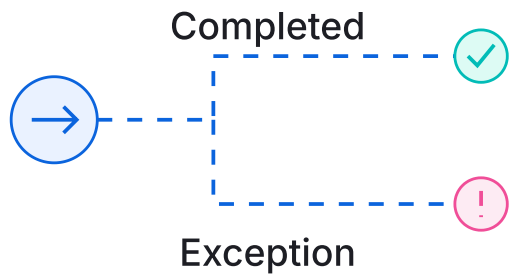

ILLUSTRATIVE · NO LIVE SYSTEMS CONNECTED Illustrative RCA. Correlation is a candidate, not a verified cause; external-provider internals remain unobserved.

Availability

Error rate by channel

PROPOSED INDICATORS Agree definitions and baselines with the bank.

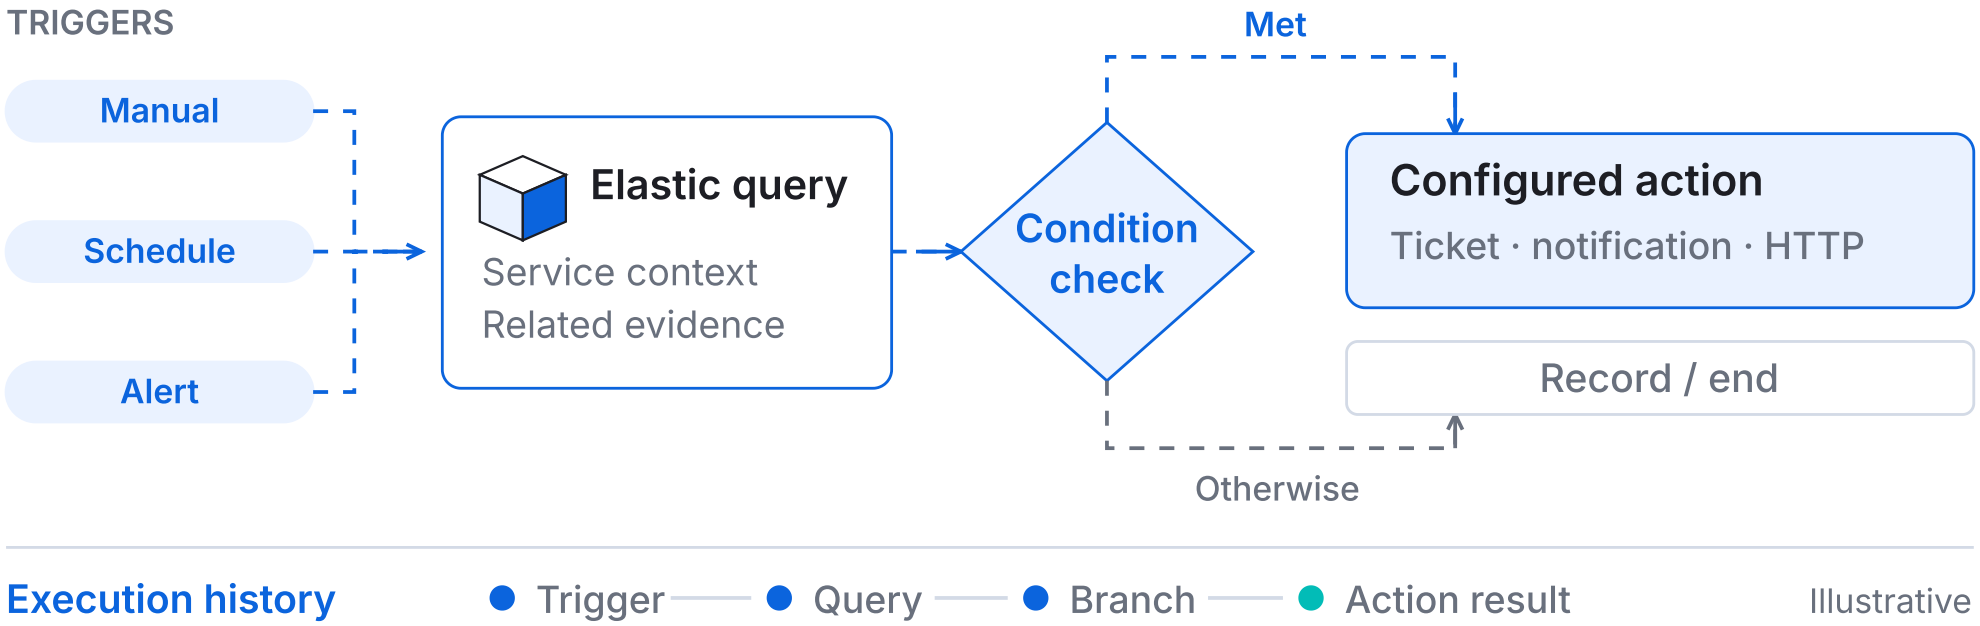

Prioritize the banking outcome, then connect the technical evidence that explains it.

ILLUSTRATIVE · NO LIVE SYSTEMS CONNECTED Proposed use cases and indicators, not measured prospect outcomes. Payment acceptance and settlement are distinct.

Workflows: turn insight into action

An authored sequence can query Elastic, apply conditions and coordinate the next steps.

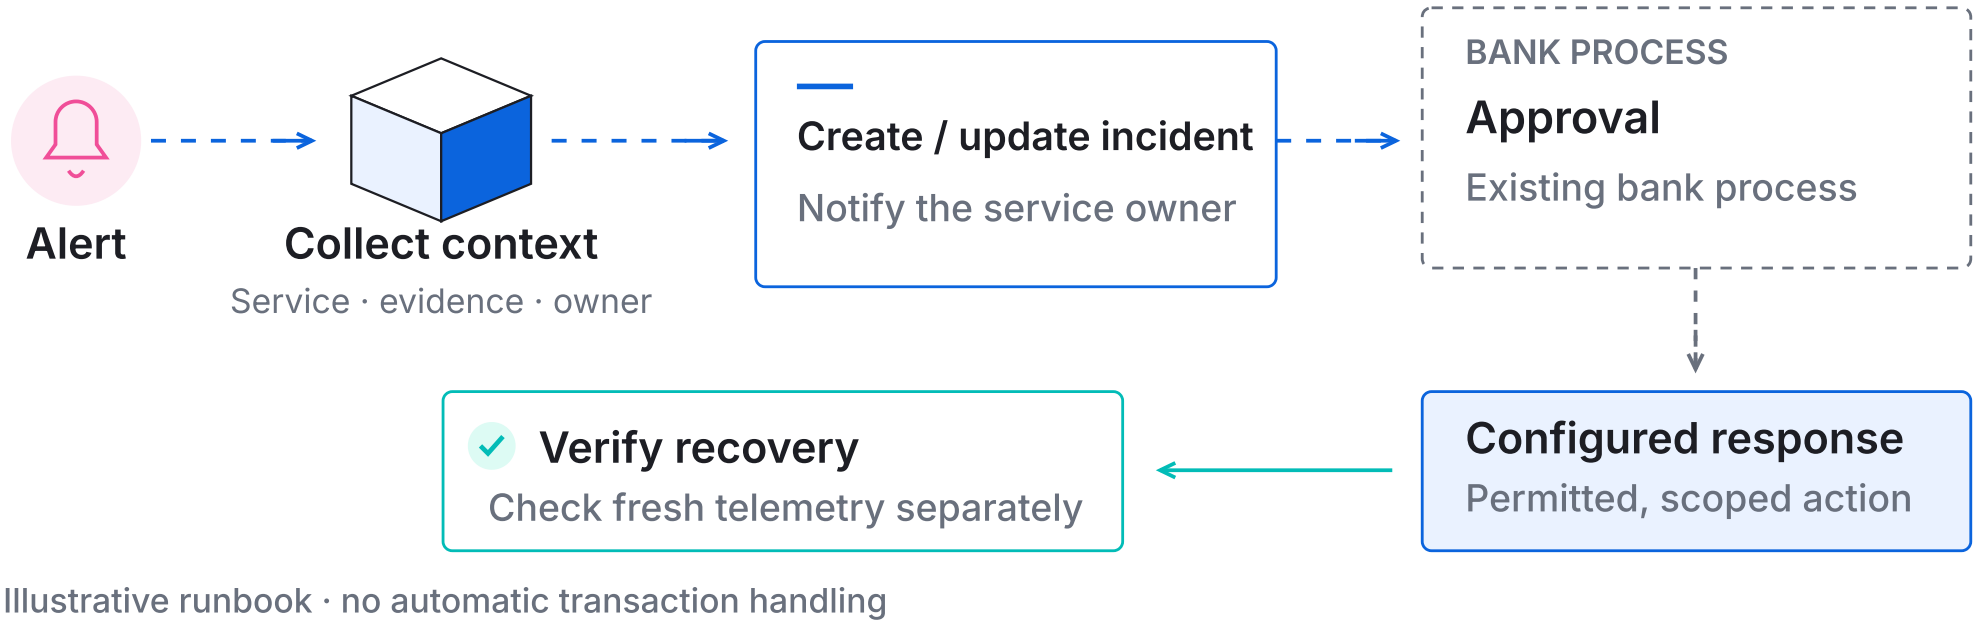

Automate the repeatable investigation work where the evidence already lives.

ELASTIC OBSERVABILITY Workflows: Stack 9.4+ GA, Enterprise. Enable the feature; permissions, actions and external integrations must be configured.

PUBLIC SOURCES Elastic Workflows overview ↗ Set up Elastic Workflows ↗ Monitor workflow execution ↗

Workflows: a repeatable response

Collect the evidence, route the incident and notify the owner—with the bank's approval process intact.

Automate preparation and coordination; authorize operational changes through the agreed process.

ILLUSTRATIVE · NO LIVE SYSTEMS CONNECTED Illustrative authored runbook. Ticketing, notifications and approval use configured integrations or the bank's existing process.

PUBLIC SOURCES Observability workflow patterns ↗ Monitor workflow execution ↗ Set up Elastic Workflows ↗

Your infrastructure. Your operating model.

Run self-managed, keep useful history searchable, and choose access and retention deliberately.

Retention, access and cost remain design choices.

Plan the approved AI model connection separately from on-premises data storage.

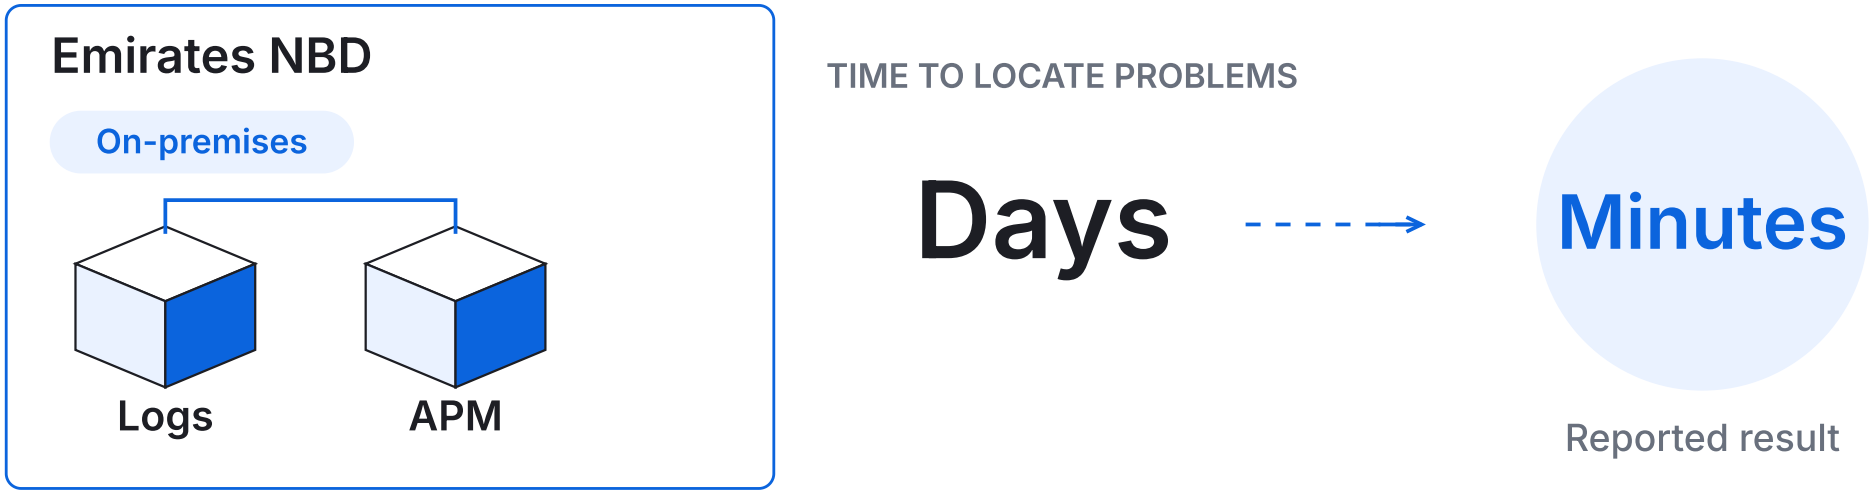

Balance investigation depth, operating effort and retention cost within the bank's requirements.

ELASTIC OBSERVABILITY Self-managed deployment is supported. Tiering, snapshots, licenses and approved data flows need design and validation.

Emirates NBD: shared investigation

Centralized logs and APM support a reported move from days to minutes to locate problems.

Public Elastic customer story · centralized logs + APM

Customer proof

Shared evidence helps teams investigate the customer-facing problem together.

CUSTOMER-REPORTED EXAMPLE Elastic-published customer account. On-premises logs + APM; not a Saudi-hosting or regulatory-approval claim.

PUBLIC SOURCES Emirates NBD customer story ↗

Two customers. Two different clocks.

Oney shows earlier detection. WePay shows faster identification of customer impact.

Why Elastic? Connect the whole loop.

Streams makes logs useful. Connected investigation explains the issue. Workflows coordinates action.

Streams

Curate useful evidence

Connected RCA

Test the explanation

Workflows

Make action repeatable

Validate one service · agree the evidence · make an informed decision

Prove that loop on one banking service, with agreed evidence, owners and success criteria.

ELASTIC OBSERVABILITY Proposed validation. Scope, access, version, subscription, baseline and response authority must be agreed.
